DE DIVI ALPHONSI

ROMANORVM ET HISPANIARVM REGIS,
astronomicæ tabulæ in propriam integritatem restituta, ad calcem
adiectis tabulis quæ in postrema editione deerant, cum plurimorū
locorū correctione, & accessione variarū tabellarū ex diuersis au-
toribus huic operi insertarū, cum in vsus vbertatē, tum difficultatis
subsidiū: Quorum nomina summa pagellis quinta, sexta & septima
describuntur. Quæ in re Paschasius Hamellius Mathematicus insi-
gnis idemq; Regius professor, sedulā operam suam præstitit.

PARISIIS,

Ex officina Christiani wecheli sub scuto Basiliensi,
in vico Iacobæo.

Anno 1545.

QVAS AD RES POTISSIMUM ALPHONSI

Tabulae conducant.

Emporum intercapedines ab Adamo ad pleraq; regna, & eorūdem inter se, Pagina 1.

Conuertere horas & horarum fractiones in gradus & minuta, aut econtrā, pag. 2.

Conuersio gradū & suarū fractionū in minutias dierū, & e diuersis, pag. 3.

Aequare longitudines & latitudines regionum & ciuitatum, pag. 4.

Tabula equationis dierum, pag. 5.

Tempora in etas reducere, pag. 6.

Tabulae motus aegium & stellarum fixarum, pag. 9.

Tabula partibus proportionalibus opportuna, pag. 15.

Planetarum argumenta & centra media supputare, pag. 27.

Locum ☉ supputare cum exemplari descriptione, pagina eadem.

Verū locū Lune supputare, et eius supputatiōis exemplū ex ordine, pag. 32.

Verum locum ☉ & ☽, ac latitudinem ☽ perscrutari, pag. 43. & 44.

Vera loca aliorum Planetarum inuestigare, pag. 45.

Modus corrigendi tabulas, pag. 81.

Planetarum omnifarias passionēs inquirere. pag. eadem, & 82.

Conficiendarum ephemeridum compendium, pag. 83.

Quinq; Planetarum latitudines venari, pag. 84.

Domos cœlicas construere, pag. 91.

Ingressus Solis in signa cardinalia, & annuas mundi conuersiones comperire, pag. 119.

Annorum & mensium ferias discernere, pag. 130.

Veras Planetarum conuersiones indagare, pag. 137.

Vtrasque ☉ & ☽ luminarium adæquare, pag. 144.

Luminarium eclipses examinare, pag. 158.

Stellarum fixarum longitudines, latitudines, magnitudines & natura, pagina 213.

EX ALIIS AVTORIBVS HVIC ALPHONSINO

operi inserta.

T abula motus augium & stellarum fixarum, Blanchini,	pagina. 13.
Tabula supputandi verum locum \odot in meridie,	pag. 116.
Tabula vernorum æquinoctiorum, pag. 122. Quæ verò pag. 121 erronea est.	
Tabula anticipationum æquinoctiorum,	pag. 123.
Modus corrigendi calendarium & ritè celebrandi Pascha,	pag. 124.
Vera & paschales ab anno 1524. ad annum 1585 cum veris Pascha diebus;	
pagina	125.
Ciclorum indictionis & epactarum inuictio cū figurationibus cōgruis, pag. 127.	
Tabula resolutionum annorum ex Blanchino,	pag. 133.
Synodos & plenilunia luminarium faciliùs supputare,	pag. 183.
Eclipses luminarium ad plerosq; annos supputate,	pag. 203.
Tabellæ motus augium & stellarum fixarum,	pag. 206.

IN PROXIMA EDITIONE DESIDERATA

iuxta harrum calcem restituta.

L uculenta declaratio tabularum temporum, & erarum consiciendarum,	
pagina	243.
Canones reducendi tempora in partes phisicas cum lucidioribus exemplis,	pag. 245.
Ignotarum erarum per cognitâs inuictio,	pag. 247.
Eræ cuiusvis minutias phisicas in annos, menses & dies reducere, pag. eadē.	

TABVLÆ PRÆDICTIS DESTINATÆ

finiunt pag. 263. Quarum series sequitur.

C elebriorum decem erarum combinationes & differentie,	pag. 249.
Tabula communes & particulares erarum Christi, Alexandri, Casaris, Diocletiani & Alphonsi,	pag. 251. & 252.
Tabula communes & propria erarum Nabuchodonosor, Philippi & Regis Persarum,	pag. 253.
Tabula eræ Arabice,	pag. 254.
	Tabule

Tabule colligentes eras diluuii & Nabuchodono. ex era Alpbösi,	pag. 255.
Tabula colligens eram Philippi ex era Alpbösi,	pag. 256.
Tabula cöponentes eras Alexandri & Cæsaris cum era Alpbösi,	pag. 257.
Tabula inuenticudi eras Christi per eras Alpbösi,	pag. 258.
Tabule eras Diocletiani & Arabü cöplectetes ex era Alpbösi,	pag. 259.
Tabula inuenticudæ eræ Persarum per eram Alpbösi,	pag. 260.
Tabula notarum annorum & mensium,	pag. 263.
Radices motuü octauæ spheræ augis ☉ & ♀, ac utriusq; & ☿ mediü motus cum mediü motus & argumenti) radicibus ad nouem præmissarum erarum initia,	pag. 264.
Radices mediü motus ☽, mediörum argumentorum ♃ & ♄, atq; augis ♃, ☿, ac mediü motus ipsius ☿,	pag. 265.
Radices augium ♃ & ♄, & suorum motuum mediörum cum utraq; radice elongationis) à ☉, & arguuenti latitudinis),	pag. 266.
Canones ad longitudines & latitudines ciuitatum spectantes,	pag. 267.
Canones ad dierum magnitudines inuenticudas,	pag. eadem.
Horas æquales in horas Planetarum conuertere,	pag. 268.
Vulgares dies in astronomicos conuertere,	pag. eadem.

AD CANONES PRAEMISSOS REFE.

runtur sequentes tabule.

Tabula dimatum, parallelorum, & quantitatis maximarum dierum,	pagina 269.
Tabula quantitatum omnium dierum anni, ad omnia Europæ loca opportuna,	pag. 271.
Vetus tabula æquationis dierum per gradus & minuta graduum,	pag. 273.

Et habes igitur quæ ab hoc opere expectes.

Aux communis.

R. augis ☿

Aux propria ☿

Augem communē, deus propriē sex planetarū per Tabulam hanc scilicet supponere.

Annos Christianae aetatis abfolutos scorum scribe. Dies autem residuos anni imperfe-
cti simul concoerato per tabulam mensium ab Ianuario incipientium. A quibus omnibus sub-
ducito annos 15. dies 137. & productū sicut prima linea annorū collectorum præcisi reperir-
tur. & regione p̄llet aux communis quam p̄scribas. Alioqui numerus annorū ac p̄missorū
cōmonstrabit augē iniquatē, & motū in anno. Quem ducito in annos exuberantes, & p̄du-
ctū augi iniquitate concoerantē cōfirmet augē equatū ac verū. Cui sigillatim exaggerentur ra-
dices augium inferas excedende, & scilicet emerget aux propria sex planetarum.

ARGUMENTA media planetarum reperire.

- ⊙ Solis argumentum medium proficit, si augē perceptam à suo medio motu diduxeris.
 ♃ ♄ ♅ argumenta media sumuntur cum propriis tabulis, sicut medi motus.
 ♆ ♁ ♂ argumenta media emergunt, si eorū mediū motus subducat à medio motu ⊙.

CENTRA media supputare.

Solis argumentum, est ♁ centrum.

♃ ♄ ♅ augem propriam subtrahere à suo medio motu, & ceteric eorū nos dist. tuisq̃.

Medium motum ⊙ subtrahere A.M.M. & proveniet elongatio seu distantia, que duplata centrum Lunæ medium appellabitur.

LOCVM ⊙ facillè supputare.

Primo reperitur M.M.⊙. Dein argumentum eius medium. Tertio è regione argumenti cape æquationem & differentiam cum unis A. vel M. De quibus facito partem proportionalem, que adiciatur vel subtrahatur ab æquatione superioris reperta, & proficit æquatio æquata hæc, ut ipfius admonet titulus, coaceruetur aut subducatur à medio motu, & consilietur verus locus ⊙ sub nomi. celis fixato.

LOCVM ⊙ exemplo supputare.

A

B

Inueniatur M. M. J. Argumentum medium & centrum, veluti *suprà* docuimus.

Secundò è regione centri, vtore cum *l.* & *g.* cape equationem centri. Minuta proportionalia & differentias cum suis titulis A. vel M. Et scribe *g.* sub *g.* & *n.* sub *n.* quodlibet sub suo genere, & si vtroque in differentia reperiatür figura subleu seu cifra, eadè centri equatio & minuta proportionalia erunt æquata. Sin verò aliquid, cum fractionibus primi eiusque differentia sic partem proportionalem, quæ in ista differentia tandem addicitur vel subtrahatur ab huiusmodi equatione in tabulis reperita. Et proficit æquatio centri æquata & vera, cui titulus A. vel M. inscribatur eodem pacto adsequentur minuta proportionalia seorsum annotanda.

Tercio *hanc* equationem centri æquatam (vti eius admonet titulus) addatur vel subtrahatur ab argumento medio, & proficit argumentum æquatam siue verum, è cuius regione finatur diuersitas diametri circuli breuis cum sua differentia & linearum titulis. Et sic diuersitatem diametri æquatam. De qua & M. proportionalibus seorsum annotata sit rursus pars proportionalia, reperiendo videlicet minuta proportionalia sinistroscum in prima linea tabule tabularum, & diuersitatem diametri *superiorem* aut econtrà, & in angulo communi siue area tabule aderit pars proportionalis diuersitatis diametri & minutarum proportionalium, quam serua. necum ad partem.

Quartò cum eodem argumento vero siue æquato accipe equationem argumenti cum eius differentia & titulis A. vel M. & sic equationem argumenti æquatam, quæ æquatio primò examinata appellabitur.

Quintò huic equationi primò examine adiecto diuersitatis diametri partem proportionalem, quam seruasti ad partem, & proficit æquatio argumenti secundò examinata.

Sextò equationem hanc secundò examinatam, vti eius insinuat titulus, adiecto, vel deducto a medio motu Lunæ. Et proveniet verus locus siue motus Lunæ in signifero *p.* orbis ad eam propositum.

C A V T I V N C V L A E.

1 Si cum centro Lunæ inuenieris in minutis proportionalibus M. o. ^{tabula} non oportebit querere partem proportionalem, neque diuersitatem diametri. Nam tunc æquatio primò examinata erit etiam æquatio secundò examinata.

2 Si cum argumento vero reperies in diuersitate diametri *g.* o. & in differentia o. minuta proportionalia nullius erunt operis, neque oportebit querere partem proportionalem cum diuersitate diametri. Sed æquatio primò examinata, erit etiam secundò examinata.

3 Si contigerit *o.* in minutis proportionalibus reperire, & o. in differentia, non erit opus querere partem proportionalem cum minutis proportionalibus & diuersitate diametri, sed ipsamet diuersitas diametri erit pars proportionalis quæ additur æquationi primò examine, vt fiat æquatio argumenti secundò examinata.

4 Quando cum centro vel argumento in tabulis equationum intrare iustetur, & fuerit aliquid in signis, & in *g.* o. resoluendum erit unum signorum in *o.* *g.* & cum signis residuis & *g.* o. intrandum erit in eisdem tabulis equationum.

[Handwritten notes and scribbles on the left margin, including a large dark stain.]

[Small handwritten note on the right margin.]

Invenitur primò medius motus planetæ, cuius verum motum desiderat. Item argumen-
tum a centro medium.

Secundò cum centro medio cape æquationem centri, & differentiam cum eorum titulis
A. vel M. & fac partem proportionalem, quæ (ut differentie titulus insinuat) adiciatur vel
subducatur ab æquatione centri inæquata, & proveniet æquatio centri æquata sive vera.

Tertiò si circa æquationem centri scriptum fuerit A. eam adicies centro medio, & sub-
trahæ ab argumento medio. Si verò M. ipsam à centro medio subducato, & adicito argumē-
to medio, & habebis veramque æquationem scilicet centrum & argumentum. Et serva hanc
centri æquationem cum suo titulo A. vel M. quia inferriis ea indigebis.

Quartò cum centro æquato cape minuta proportionalia longiora vel propiora, prout ta-
bula insinuat, & cum eorum differentia adæquentur & serventur ad partem.

Quintò cum argumento æquato accipe diversitatem diametri circuli beatus, sub longi-
tudine longioris, si minuta proportionalia fuerint longiora: sub propioræ ætate, si propiora,
& cum eius differentia & rebūto argumenti adæquetur huiusmodi diversitas diametri.
Cum qua & minutis proportionalibus superà ad partem servatis fac partem proportionalem,
quam servabis foreūm, & scribe circa ipsam M. si diversitas diametri accepta est sub longi-
tudine longioris, vel A. si sumpta fuerit sub propiore.

Secundò cum argumento æquato accipe æquationem argumenti cum sua differentia & capi-
torum A. vel M. denominatione, & si opus est, fac æquatio argumenti æquata, quæ primò
examinata appellabitur.

Septimò æquationi huic primò examinatae adiciatur pars proportionalis diversitatis di-
ametri superiùs servata, si circa huiusmodi partem proportionalem littera A. inscruatur. Si
verò M. subducatur, & proveniet æquatio argumenti secundò examinata, circa quam scribatur
nota A. vel M. veluti titulus dicte æquationis insinuat.

Octavò si circa hanc æquationem argumenti secundò examinatae, & æquationem centri
superiùs servatam veròbique reperiantur littera A. concertato eas ad invicem, & cogeries ad-
ciatur medio motui, & proveniet verus locus planetæ. Si verò circa utramque reperiantur li-
tera M. exaggerato eas, & productum subtrahatur à medio motu. Verùm si circa unam re-
periantur littera M. & circa alterà A. subtrahæ minorē à maiore, & iuxta tituli maiora æqua-
tionis adde vel subtrahæ à medio motu, & p̄lliet verus locus planetæ sub zodiaco 9. s̄p̄d̄r̄q̄.

Hic nullo indiget exemplo, si quod super docuimus in 3. ro. d̄ didicisti.

Advertas quoddam semper in istis tabulis quandoocunque præcipitur, ut subtrahatur vnus
numerus ab altero, necesse est illum subtrahere, licet sit maior numerus subtrahendus quam
ille à quo debet fieri subtractio, sed minori numero addenda sunt 6. signa phisica, ut pote
vna circuli revolutio, postmodum fiat huiusmodi subtractio.

an ut resipiat in
manibus

Advertas quod si vnus
numerus maior sit
v. 3. 2.

| | 3 | Adde | A | | M | | | | A' | Minus | A | | A' | | | | | |

Animaduertendum quod si quando in tabulis æquationum adesset paragraphus, tunc in differentia, & superius & inferius ponuntur A & M vel ð contra, vndeq; subducitur alter. Translinea superior sine exterior defersit differentia que sunt supra paragraphum. Inferior autem eis que paragrapho subacta. Verum si literæ huiusmodi fuerint inferius annotatae, infima defersit differentia que sunt infra paragraphum. Suprema autē differentia super dicitur paragraphum annotata. Sed ne fortassis decipiatis, aderte si numerus æquationis tam ascendendo tam descendendo excreuit, tunc in differentia scribatur A si verò decreuit, M. & ita non aberrabis.

Modum corrigendi tabulas æquationum sine medicorum tutum argumentorūq; subnectere. Et si libuerit nouas fabricare.

Numerus in prima tabule linea scriptus, est motus vnius diei, quæ dupla, & proficit motus duorum dierum, cui additio primam quoq; numerum, & proueniet motus trium dierum & sic deinceps donec perficias. 60. lines, & completi erit tota illius modis motus tabula. Sed si dubitas de aliquo linea vtrum sit bene scripta, videas lineam immediatè precedentem illi de cuius veritate dubitas, & eam scribere fecerim cui addit motum vnius diei vtique primam tabule lineam, & qui proficit numerus erit ille de quo dubitabas. Verum si dubitares de prima linea fecerim scribere quancunque libuerit lineam. Deim maiorem immediate sequentem, & subducito minorem à maiore, & proueniet numerus primæ lineæ qui est motus in vna die.

Planetarum passionem perscrutari.

Luna non dicitur directæ neq; retrogradæ, sed cursu veloci, tardæ, vel æqualis. Hæc passionem ita regeret. Si argumentum lune æquum sine verum fuerit minus vno signo physico cum dimidio, vel plus quatuor eam dimidio, erit cursu tardæ. Si verò fuerit plus vno signo cum dimidio, & minus 4. cum dimidio, erit cursu veloci. Si deniq; fuerit præcisè vnum signum eam dimidia, vel præcisè 4. cum dimidio, erit cursu æqualis.

Vel aliter sic.

Habito motu lune vero, quæritur locum eius verum in altera die statim sequente, & subtrahere minorem à maiore, & numerus ex tali subtractione proueniens si aequalibatur, G 13. M. 1. æqualis cursu vocabitur. Si autem minor, tardæ. Si maior, veloci.

Planetarum ortus & occasus matutinos ac vespertinos inuestigare.

An ♁ & ♁ sint æquales vel inæquales

Si locus ipsorum fuerit minor loco solis, subducito locū alterutrius à loco ☉, & p̄lliet differentia

Handwritten notes in the right margin:
 An ♁ & ♁ sint æquales vel inæquales
 Si locus ipsorum fuerit minor loco solis, subducito locū alterutrius à loco ☉, & p̄lliet differentia
 An ♁ & ♁ sint æquales vel inæquales
 Si locus ipsorum fuerit minor loco solis, subducito locū alterutrius à loco ☉, & p̄lliet differentia
 An ♁ & ♁ sint æquales vel inæquales
 Si locus ipsorum fuerit minor loco solis, subducito locū alterutrius à loco ☉, & p̄lliet differentia

18^o 11^o 8^o 10^o 12^o

ferentia ^Q possit dnm i regione signi in quo fuerit planeta, Insuper secundum tabellas sibi ordi ^Q iustitiam secundum veluti procedens problema edocuit, & gradus ac minuta ibidem reperti, si fuerint plures gradus differentie, erit planeta occidens & occidentis & occidens, nec videtur poterint vni pauciores, erit orientalis & apparet. Verum si locus Φ & Ψ fuerit maior loco \odot , sic contrari, & differentis erit planetae. Tunc in eisdem tabellis sibi occidens vespertino secundum p^ois reperto, eius planetae signum illud offeret etiam tibi quidem gradus & minuta, qui si fuerint plures gradibus differentie, planeta ipse dicetur occidens & occidens pauciores, orientalis & apparet.

Namque tres superiores Ψ Φ Ψ ^{apparet} sunt orientalis vel apparet.

Efficit differentiam cordi ac sole, veluti in Φ & Ψ diximus, & si differentia erit planetae, intra eum eius signo in tabellam occasu vespertino, & gradus cum M. ibidem scripti, si fuerint pauciores gradibus differentie inter planetam & \odot , erit planeta apparet in occidentem sui planetae, erit t^ois ac latens sibi eisdem solaribus. Si vero differentia erit \odot , in eadem tabellam ortus matutinus cum signo in quo fuerit planeta, & gradus ibidem annotati si fuerint plures gradibus differentie, erit planeta occidens si pauciores, orientalis & apparet.

Vel aliter de horum gradibus planetarum, sicut in h^o vel in h^o.

Quando Φ & Ψ non sunt solum antecedunt sive diluculo oriuntur ante solem, & ex consequenti occidunt ante \odot , ut ip^orum gradus sint pauciores gradibus \odot , orientales de nominibus confecerunt. Dum vero solem insequuntur, & oriuntur atque occidunt post solem, gradus siquidem ipsorum sunt plures gradibus \odot , occidentales appellabuntur. Tres autem superiores orientales dicuntur quia \odot ab eis post coniunctionem ad oppositum ipsorum p^ogitur. Quia oppositioris perasit, occidentales appellabuntur, hinc iterum eis complicabitur.

Planetarum velocitates, tarditates, & equalitates reperire.

Quandocumque verus situs planetae fuerit maior suo medio dieo, dicitur suo cursu velocius si minor, tardus si aequatur veritate medio motus, erit cursu equalis.

Verum planeta sit ascendens vel descendens in suo circulo differentie, secundum.

Cum fuerit centrum planetae equatum ab uno gradu in Φ , erit descendens in suo circulo suo deferente, & ab 3 in 6 ascendens. Ille planeta qui fuerit propinquior summitatibus suorum circuloz datur elevatus super illam qui fuerit remotior a summitatibus suorum circuloz, quod ipsorum signum commoventur. Si enim gradus exempli argumentum equum Martis fuerit Φ 2. Φ 3. Φ 4. Φ 5. Φ 6. Φ 7. Φ 8. Φ 9. Φ 10. Φ 11. Φ 12. tunc Φ fuerit elevatus super Iovem. E converso tamen de Ψ in epicyclo: quia ex quo in superiori parte sui epicycli movetur contra successione signorum, inferiori vero secundum: hoc in prima medietate sui epicycli ascendit, in secunda autem descendit.

Verum planetae sint directi, retrogradi, vel stationarii, intelligere.

Cum centro equo intra tabulam stationis illius planetae de quo huiusmodi passiones fieri desideras, & stationem primam in eius directo reperit subtrahat de 6 signis, & proficiat statio secunda. Postea vide si argumentum equatum eisdem planetae fuerit equalis stationi primae in Φ , G. si erit planeta stationarius statione prima, incipiens tamen retrocedere.

Si vero fuerit plus statione prima, & minus secunda, est retrogratus. Sed si fuerit equalis stationi secunda, erit stationarius statione secunda. Quod si fuerit plus statione secunda, vel minus prima, erit directus. Similiter si fuerit plus statione prima de secunda. (si

| | | | | | | | |
|--|----------------|---------------|---|---------------------------------------|---------|---|------------|
| Si argum ^o ti equali fuerit | Ac si statione | Plus statione | { | prime—Stationarius statione prima | incipit | { | retrograda |
| | | | | secunda—Stationarius statione secunda | | | Dirigi. |
| | | | | prima & minus secunda—Retrogratus. | | | |
| | | | | secunda, & minus prima | | | Directus. |
| | | | | prima de secunda | | | |

Atque si argum^o ti equali fuerit plus statione prima, & minus secunda, erit retrogratus.

A. Cum ergo sit equalis stationi primae, & minus secunda, erit retrogratus.

Quod si argum^o ti equali fuerit plus statione prima, & minus secunda, erit retrogratus.

MOTVM argumenti planetarum in vno die perforari.

In tribus superioribus motus argumenti in vno die praesentet, subtrahendo medium motum vasculi cuiusque eorum in vno die à medio motu solis in vno die. Ita Q & R sequuntur in propriis tabulis mediorum argumentorum.

Perforari tempus quando incipit dirigi.

Si argumentum medium illius planetae fuerit plus statione secunda, subtrahat stationem secundam de argumento medio, & quod post subtractionem remanserit diuide per motum argumenti planetae in vno die si poteris, & habebis in quotiente dies.

Si vero diuisi non poteris quoniam maior fractione erit diuisor quam diuidendus, multiplica illud per 60. & similiter si post primam huiusmodi diuisionem aliquid remanserit, & productum diuide per id quod prius, & habebis in quotiente M. horarum. Et si post hanc diuisionem aliquid remanserit, multiplica eum per 60. & productum diuiditur per eandem diuisorem, & habebis in quotiente \bar{r} diuisionum per omnia reductis ad horam & horarum fractionem. Illud tempus sic repetam subtrahat à tempore in quo tuam planetam acquisisti, & remanebit tempus quo planeta incipit dirigi.

Si vero argumentum illud fuerit minus statione prima, subtrahat stationem secundam de 6 signis, & remansit adde argumenti autem, & totum illud aggregatum diuide vt dictum est, & negotiare vt prius. Si argumentum medium fuerit nihil, stationem primam diuide modo iam dicto, & tempus ex hac diuisione productum subtrahat vt prius, & habebis intentum.

Investigare tempus quando retrogradari incipiet.

Si argumentum medium fuerit plus statione secunda, subtrahat illud de signis 6. & remansit adde stationem primam, & totum aggregatum diuide modo iam dicto, & tempus ex hac diuisione productum addas tempori in quo tuam planetam acquisisti, & resultabit tempus quo tuam planetam retrocedere incipiet.

Si argumentum medium fuerit minus statione prima, subtrahat ipsam de statione prima, & vt dictum diuide vt prius, & tempus habitum ex hac diuisione addas vt supra, & habebis initium retrogradationis eiusdem planetae. Si argumentum medium fuerit nihil, totam stationem primam diuide modo iam dicto, & tempus resultatum addas sic, & habebis intentum.

Investigare tempus in quo planeta retrogradus incipit retrocedere.

Stationem primam de eius argumento medio minue, & residuum diuide sicut docuimus, & tempus ex tali diuisione praesentibus subtrahat à tempore quo tuam planetam verificasti. Et resultabit tempus quod quaerimus.

Inuenire tempus quando dirigi incipiet.

Argumentum eius medium minue à statione secunda, & residuum diuide vt prius, & productum te impus addas tempori quo tuam planetam acquisisti, & fiet votorum compositum.

Ratio solis & planetarum hoc est motus ipsius planetae directi acquisiti in vno die perquirari. In huius numeri, cum citro aequo cape motum centri siue puncti, cum argumento autem aequo motum portione, & si saperit in tabella non fuerit scriptum retrogradus, conuenit huius duos motus, & proficit motus directus in vno die. Si vero supra ipsum scribitur retrogradus & fuerit motus portione minor motu centri, subtrahat minorem à maiore & residuum est motus planetae in die, & planeta adhuc est directus. Si vero motus portione maior fuerit motu centri, est planeta retrogradus, tunc enim accipitur residuum post subtractionem, eritque motus directus in die per retrogradationem. Si autem duo motus fuerint aequales, erit planeta stationarius.

Veros motus Planetarum post aliquot dies reperire.

Si planeta est directus, inuenias motum eius directum in vno die, per quem dies motum eius verum scire desideras, & colle tuas ex hac erit motus planetae verus in diebus praepositis, quem adducto motui planetae prius supposito, & habebis locum planetae ad dies successus.

| | | | | | | | | | |
|----|----|----|----|----|----|----|----|----|----|
| 1 | 2 | 3 | 4 | 5 | 6 | 7 | 8 | 9 | 10 |

| 51 | 52 | 53 | 54 | 55 | 56 | 57 | 58 | 59 | 60 |

Handwritten notes and calculations in the right margin, including a table with numbers 1-60 and some text.

Extensive handwritten notes and calculations in the right margin, including a table with numbers 1-60 and some text.

Sed si planeta fuerit retrogradus, sicut planeta directo scilicet, subducto ex retrogrado, & habebis incertum.

Si volueris scire locum eius in diebus elapsis ante diem in quo traxit planetam supputasti, & fuerit directus, subtrahat quod per illam multiplicationem inuenisti. Si vero retrocedens, addito, & habebis quod tota mente petbas.

Latitudinem φ intelligere.

Cum argumento vero intra tabellas φ sub linea numeri, & utroque tam declinationis quam reflexionis numero ex ducto reperos scorsim scribe. Dein eius centro vero adde 90 . & cum residuo (abscissis 6 . signis si oportuerit) ingredi eadem lineam numeri, & minuta proportionalia ex ducto reperita scribe etiam ad partem. Tercio cum his & declinatione superioris seruatim fac partem proportionalem, sicut infra docebimus, & proficit prima eius latitudo examinata que provenit ex declinatione epyclij. Que quidem meridiana appellabitur si argumentum verum & centrum verum cui 90 . φ . addidisti, fuerit in eadem parte circuli, hoc est, siambo sint computi in superiori medietate tabelle, aut ambo in medietate inferiori. Sed si vtrum fuerit reperitum in vna parte, alterum vero in altera, erit latitudo septentrionalis. Circa igitur hanc latitudinem scribe septem. vel merid.

Dicitur etiam in istis tabellis medietas superior vel inferior.

| Quidq; centrum vel | δ | ζ | $\bar{\zeta}$ | $\bar{\delta}$ | |
|---------------------|----------|---------|---------------|----------------|----------|
| Argumenti fuerit ab | o | o | ad 1 | 30 | Superior |
| | 4 | 30 | ad 6 | o | medietas |
| | 1 | 30 | ad 4 | 30 | Inferior |

Quarto cum simplici circulo φ prius reperito scribet antequam fuerit sibi addito 90 . gradum, assumito minus proportionalia, que in duobus locis scorsim scribe, postea accipe partem proportionalem reflexionis secundum proportionem horum minorum proportionalium ad 60 . & hac erit reflexio examinata septentrionalis quidem, si centrum illud simplex fuerit reperitum in medietate superiori, & cum hoc argumentum verum fuerit minus 3 . signis phyticis; si vero plus, erit reflexio meridiana. Si vero centrum verum fuerit in medietate inferiori, & argumentum verum minus 7 . 3 . erit reflexio illa meridionalis. Sed si argumentum verum fuerit plus 7 . 3 . dicitur reflexio septem. Que quidem erit latitudo secundum examinata procedens ex reflexione epycl.

Quinto de minutis proportionalibus in altero loco scorsim scriptis accipe sextam partem, que erit latitudo tertia examinata procedens ex declinatione deferentis ab ecliptica, & que semper ista latitudo septentrionalis. Istas denique latitudines adiuuam collige, si omnes fuerint in eadem parte: verum si una fuerit in parte septem, & altera in meridionali aut φ conuersa, subtrahat minorem a maiore, & residuum erit latitudo φ verificata sept. vel meridiana titulum maiore.

Latitudinem φ supputare.

Cum argumento vero accipe declinationem atque reflexionem, & que scorsim scribit. Dein si centrum verum fuerit in superiori medietate ex sola reflexione decimam partem nauat. Si vero in medietate inferiori, decimam partem reflexionis super dictam reflexione addit, & quod post additionem vel subtractionem provenit loco primae reflexionis seruatim ad partem, guma iam deleta. Postea centro vero φ adde 7 . 4 . G . 30 . abscissis tamen 6 . φ . si oportuerit: & cum residuo vel cum 60 quod fuerit minus cape M . proportionalia, cum quibus & declinatione seruatim fac partem proportionalem, sicut infra docebimus. Que vocabitur latitudo prima examinata proficit ex declinatione epyclij: alteram quoque ista latitudo secundum vel australis, vel in φ problematica dicitur. Deinde centro vero

Vero loco ☉ & regione prospecti mensis annotato, adiciatur quod ex directo tui anni voluentis compertum fuerit, & congeries erit verus locus ☉ in zodiaco, in meridie diei obtine, si annus fuerit bifertilis. Sin communis post 28. Februarii lucem, in singulis diebus mensium ex congerie illa unum gradum subducto.

Introitum \odot in Υ & quacumque signiferi partem reperire.

Prequirito locum \odot verum ad tempus in quo a biemis quod \odot parum distet ab Υ , et si tunc sol esset in β .o. δ .o. Υ . Tempus acceptum erit quod perferat hanc. Sin secus, vide distantiam ab Υ , quam scies per subtractionem veri motus \odot ab β signis δ quod reductio ad β . vel β . post hoc factis moti \odot in una hora, quam reducto etiam ad eadem genus ob similes denominationis ad quam reducti distans \odot ab Υ : postmodum divide distantiam per motu solis in una hora & in quotiente proficiet horæ. Et si post divisionem aliquid remanserit, multiplica illud per 60. & quod provenierit divide per id quod prius, & in quotiente aderit M. horæ: quas horas & M. addas tempore exiguo si sol notandum perveniat ad primum δ . Υ . vel ab ipso mane si transierit, & proficiet tempus introitus \odot in Υ verum. Si provenient β .o. β .o. δ .o. supputando locum solis: sin secus, retera, ut diximus, quoad veritas eligerat. Eodem pacto negociare in cæteris signis. Horis igitur ac M. sic reperiis adde horas ζ . δ . & proficiet horæ & M. post meridiem in quibus \odot anno sequente ingreditur primum M. Υ . & scilicet incipit ad plerisque annos.

Introitum \odot in signa cardinalia Υ δ ζ β facilius investigare.

Apud ephemeridas vel per tabellam superius annotatam tempore x. Iuce Martii, quando \odot peragraverit Υ . 29. partem. Dein quod minutale partes defuerint ad eandem usque Υ , repote distantia minutarum reperiantur in sequentis tabellæ prima vel secunda numerorum serie, & qua dextrosum è regione comperies horas & M. post meridiem infinabunt tempus in quo \odot introcedet primam Υ minutalè partem. Ad illas horas & fractiones erigito schema cœllesum, & quid illo sequenti anno futurum sit discipato. Sit \odot exempli gratia in G. 29. M. 40. Υ . Tunc ad calcem pisiuum intenebitur essent minutale partes 20. que ad dextram cum monstrabunt H. 8. M. 63. 40. post meridiem: sin foret distantia M. 45. tunc \odot ingrederetur primum Υ manuum decima die Martii horis 18. M. 15 post meridiem. Eodem pacto negociare in cæteris signis cu cardinalibus.

Si annus in quo scire volueris ingressi \odot in γ , sit
 erit bisextilis, & post annu saluti 1516. subtrahere
 annos 1516. ab tuo faciente: & residu parti per
 4. & numerus quotiens insinuat dies, horas, & q;
 fractiones subtrahendas ab diebus, horis ac frac-
 tionibus radicis. *Qui scripti sunt e regione linte 516.*
 Eodem pacto si annus tuus in quo scire volueris
 introitum \odot in γ seu æquinoctium verum, fuerit
 gratia exempli secundus post bisextum, veluti
 annus 1518. subtrahere hunc 1518. ab tuo anno
 labete, & productum diuide per 4. Et numerus quo-
 tiens commensurabit à dextris numeros subtrahen-
 dos ab numero radicis utpote anni 1518. & ita
 deinceps. Verum si annus propositus fuerit ante
 annos radicem, deme annum tuum oblatum ab
 annis radicem, videlicet 1516. si fuerit intercalaris,
 aut 1517. si primus post bisextum: vel ab anno sa-
 lutis 1518. si 2. & productum diuide per 4. & nu-
 merus quotiens indicabit e regione quid numeris
 radicem sit addendum, & quod ex huiusmodi sub-
 tractione vel additione proveniet, erit tempus
 vernalis æquinoctii.

Si quidem quolibet anno 136. elapso æquinoctiū per vnam feriē diem anticipabunt, vnde sacrum pascha festiſque mobilia ex decreto Saluatoris minimè celebrantur. Aequinoctiū namque verum quod contingebat 25. Martii sub Iulio Cesare, sancti ecclesie patres illud statuerunt in concilio Niceno 21. ciuilem. Quorum decreta ad hanc vsque tempeſtatem ſacrosancta obſeruat eccleſiaſiquam tunc 10. Martii luce celebratur.

Angelo etenim domini nunciūſe ſacrum eſt, vt ſacrum pascha celebretur luna 14. primi menſis, quem Martio dicunt eccleſie antiftites & aſtologi, quando ſcilicet ☉ per Arietis ſignum progreditur non autem ſecundo, qui immundiorum dicitur eſt, dum ſcilicet ☉ Taurum peruenit. Lunam 14. ſuis 15. appellat, quando fit pleniluniam: & luminaria ☉ & ☽ in iudicem diametro inuicem obſpiciunt. Circa quam diem recuſi ſabbatarii ſuum pascha celebrant, nos autem die Dominica ſequenti, ne pascha noſtra cum Hebraica obſtinatione coincidat. Eſt enim illa Solis dies ſacraſſima domino noſtro Ieſu Chriſto dicata, qui eſt lux vera illuminans omnem hominem venientem in hunc mundum, reſuſcitatus totum orbem ſuis fulgentiſſimis radiis illuſtrat. Sabbatarii præterea ex Moſis conſtitutione non celebrant pascha die ☽, nec die ☿, neque ♄. Ex incuria noſtrorum patrum ſepe nemerò nos ſacrum pascha celebramus ſecundo menſe, qui (vt diximus) immundus deputatus eſt, & præſertim quando pascha angelicum celebramus die 24. Aprilis: tunc enim contra patrum decreta 35. dierum intercapedine illud ſacrosancta retardat eccleſia. Verum eniuſmodi remota erroris cauſa, & effectus erroneus remouebitur. Si æquinoctium verum ſummorum pontificum atque Ceſarū decreto ſtabatur 10. die Martii. Cum hac tamen conſtitutione, vt ſemper elapſis 136. annis, Februario niſi dies adiciatur intercalaris, & qui deberet eſſe biſextilis annus, effluat communis ſeu ciuilis, annus tamen quartus ab illo vt pote 140. efficiatur biſextilis, & Februario de more dies intercalaris adſatur, & ita ſucceſſiue ad totidem alios annos 136. hoc eſt, quando effluat annus 272. ſit ciuilis non autem intercalaris.

Exempli gratia quando uolentur anni ſilatis Chriſtiannæ 1660. 1796. 1932. 2068. 2204. 2340. qui deberent eſſe biſextiles, effluant communes. Niſi ſo ſecus anni 1664. 1800. 1936. 2072. 2208. 2344. labantur intercalares. Et ita quilibet anni 4. interſtantes ad ſtatam vsque annos efficiuntur biſextiles; hoc enim pacto vix in decem milibus annorum per duos dies naturales æquinoctiū ſine æquidalia atque ſolſtitia anticiparent.

Amorū igitur erroris cauſa, poſt vni æquinoctii diem immediatè reperitur vera, non autem media humanarum oppoſitio (quemadmodum ex noſtris plerique ſcripſerunt) luna ſcilicet 15. ſeu maioris 14. Detrum die dominica illicet ſequenti, ex diuino precepto poterimus verum pascha noſtram ſacraſſimum nūcō celebrare ipſo. Quo daxe reliqua feſta mobilia moderantur.

In annis precedentibus præposito ordine numerabitis: & ubi terminabitur numerus tuorum annorum, erit inferius in rotula annotatus cycli solaris numerus, & sub eo littera dominicalis: que si una occurrerit, annus ille erit communis sine ciuilis duplex, bisextilis: & superior littera deferuet usque ad 4. Februarii: inferiori uero in reliquo anni. In annis autem sequentibus recta procedas via.

Si quispiam scire volet aurei numerum sive cyclum lunarem post annos Christi 1538. exordietur ut prius: adeo quod anno 1539. rursus aureus numerus erit 1. dein 1540. erit 2. & ita procedat in infinitum. In annis autem elapsis retrograde numerabis, sive per postero ordine: & ubi definet tuus anni oblati numerus, aderit etiam & numerus aureus. Eodem quoque pacto negociare pro cesarea inditione repensenda, tam in annis praeteritis quam futuris.

Annis Christi adde 1. & congerere distribue per 19. & si quod fuerit residuum, erit aureus numerus. Inditionis autem numerus proficet, si annis Christi addeceperis 3. & productum distribuas per 15.

Annos Christi partire per 18. & si quod remanserit, erit numerus sextarum. Cui si addeceris 9. cyclus solaris proficet.

Aureus numerus dicitur per 11. & a productum, si oportuerit, subducatur 30. quoties poteris, & quod remanserit, erit epacta anni adde 11. & proficet epacta sequentis anni: & ita de-

GRADVM horoscopi supputare.

Ascensionibus obliquis horoscopi natalicū aut alterius thomatis adiecto §. 87. M. 1. §. quorum ascensu abiectis §. 169. si oportuerit reperitur in area tabule primū mobilis sub tuo finitore, & supermē habebis signum in latere autem sinistro gradum quilibet horoscopi bit 4. no sequente. Eodem pacto quotannis sigillatim procedas.

Conversiones mensuram persequari.

Diebus, horis ac M. annue conversionis addantur 28. 3. 18. & statim emerget tempus mensuræ conversionis in mediā sequentis, in quo thema cōvicum erigere poteris, & vaticinari quid illo mense confecta siderum sidera pollicentur. Chronocrator siue dominus anni erit eū primū mensis. Secundi autem mensis erit moderator dominus signi immediatē sequentis, & sic de ceteris 12. mensibus quos professionales appellamus.

Dignoscere signorum gradus qui singulis mensium diebus natorum scepra teneant.

Cum diebus completis qui ab die conversionis annue effluxerunt ad diem vique illum in quo illud scire desideras intra primū sequenti tabellā, & quod ex directo ipsorum reperis dextrorsum adiungas gradibus ac M. cūlibet planete applicatū. & giall. ille enim gradus in quo terminabitur numerus erit gubernator illa die, hospitator autē eius erit Chronocrator siue dominus: verum si congeries illa excesserit § 30. dividatur per 30. & in quotiente emergent signa connumeranda à principio signi in quo erat tuus Apletus. In secunda autē tabella sequenti adnotā §. §. m. nec opus erit pariter gradus per 30. Sed si quilibet gradus superfluit vobis erit gubernator illa die, eius verō dominus Chronocrator. Itaque quibuslibet diebus 2. hor. 3. M. § 2. conribentur signum vnum, ut tertia insinuat tabella.

Tabella adnotans diebus, & annis conversionis. Anno 1692. M. § 169.

Profectuum

Profectuum

Tempus σ' vere planetarum inaequare.

Considera diem propinquum in conjunctione, vel quo estimas eorum conjunctionem fore proximiores: & quare vera loca eorum ad meridie illius diei. Et si loca illorum planetarum eadem sit in signis, gradibus, minutis & secundis, &c. tunc eadem die celebrabitur eorum conjunctione. Si autem non eadem sunt, ut dicitur, tunc subtrahere motum minorem à maiore: & illud quod remanet, erit longitudo illius, cuius motus erat maior quam longitudo alterius. Deinde invenias motum cuiuslibet illorum planetarum in uno die sibi sequente, & si ambo planetae sint directi, vel ambo retrogradi, tunc subtrahere motum diei planetae tardioris à motu diei planetae velocius, et quod remanserit, erit longitudo, sive eorum. Quo facto reduc longitudo quae est inter ipsos ad idem genus, scilicet vel 3 &c. & superatione ad illud idem genus. Quo facto divide longitudinem per superationem, si potes: & numerus quotiens erunt dies. Et si aliquid post divisionem remanserit, multiplica illud per 60. & postea divide per idem quod prius, & numerus quotiens erunt minuta diei. Et quod post divisionem remanserit, multiplica per 60. & divide per idem quod prius, & numerus quotiens erunt secunda diei. Quibus expeditis tempus quod invenisti per divisionem, adde tempus ad quod quaesivisti vera loca illorum planetarum: & hoc si tunc illa conjunctione vera est adhuc futura, hoc est, si planeta tardior praecedat velociorem. Vel subtrahere ab eodem tempore, si conjunctione vera est praeterita, id est, si planeta velocior praecedat tardiores. Et tunc quod post additionem vel subtractionem pervenerit, erit tempus conjunctionis vere. Advertas tamen quod in retrogradatione eum planetae dicimus praecedere, qui minus habet in signis, gradibus & minutis. Si vero unus eorum fuerit directus, & alter retrogradus, quod saepius contingere potest in conjunctionibus Venus & Mercurii cum tribus superioribus: licet inter se non possint hoc modo eorum quoadmodum sunt conjunctiones, esse retrogradi in uno die post tempus conjunctionis. Quibus habitis lege alios duos motus simul, & per illud quod pervenit, divide longitudinem, ut patet dictum est. Et si locus planetae retrogradi fuerit minor loco planetae directi, praeterit illa conjunctione: tunc subtrahere tempus quod per divisionem invenisti à tempore ad quod quaesivisti vera loca illorum planetarum. Si vero planeta retrogradus fuerit plus in gradibus & minutis quod directus, tunc conjunctione adhuc est futura. Quare adde tempus quod erit per divisionem ad tempus quo quaesivisti vera loca illorum planetarum, & tunc quod post additionem vel subtractionem pervenerit, erit tempus vere conjunctionis. Si autem volueris multum praecipuum scire tempus conjunctionis vere, oportet te ad illud tempus ad quod nunc invenisti planetarum vera loca rursus quare, & si invenieris eos in eodem loco, statim sine secus, rursus negociare ut prius. Motus autem cuiuslibet planetae in uno die invenies, veluti supra docuimus. Motus autem in uno minuto diei, vel in una hora reperies inveniendo vera loca eius ad duo tempora per unum minutum diei directum, aut per unam horam. Dicitur namque, motus talis erit motus eius in uno minuto diei, vel in una hora, secundum quod operatus fuerit.

TEMPVS conjunctionis cuiuslibet planetae cum quolibet stellarum fixarum invenire.

Scias primo locum sit liquidum eundem verum locum planetae ad tempus propinquum conjunctioni per estimatum esse: & videas distantiam, hoc est, longitudinem inter planetae & stellam, cuius fuerit longitudo ipsius planetae vel stellae fixae. Deinde scias motum planetae in uno die, vel in uno minuto diei, vel in una hora. Nec cures de motu stellae fixae in die, quia motus eius imperceptibilis est in tam parvo tempore. Deinde longitudinem divide per motum planetae in die &c. secundum quod operari volueris & tempus quod per hanc divisionem pervenerit, modo dicto in conjunctionibus planetarum addas ad tempus estimatum prius habitum, si longitudo fuerit stellae fixae, & planeta directus, vel si longitudo fuerit planetae, & ipse retrogradus. Si vero longitudo fuerit planetae, & ipse directus: vel si fuerit stellae fixae, & planeta retrogradus, tempus quod habitum est per divisionem superaddes, subtrahes ut à tempore estimato, & quod post additionem vel subtractionem pervenerit, erit tempus quod quaesivisti, vel tempus illi valde propinquum quod ut habes praecipuum, revertens praecipuum si oportet, donec veritas eluceat. Sed

Handwritten note:
 In die huiusmodi
 non oportet
 quod subtrahatur
 motus diei
 planetae tardioris
 à motu diei
 planetae velocius
 sed addatur
 motus diei
 planetae velocius
 ad motum diei
 planetae tardioris
 quod remanserit
 erit longitudo
 illius cuius motus
 erat maior

Handwritten note:
 Hoc tempus
 conjunctionis
 est tempus
 quod pervenit
 per divisionem
 longitudo
 inter ipsos
 ad idem genus
 superationem
 per superationem
 si potes
 numerus quotiens
 erunt dies
 si aliquid post
 divisionem
 remanserit
 multiplica
 illud per 60
 & divide
 per idem quod
 prius
 numerus quotiens
 erunt minuta
 diei
 quod post
 divisionem
 remanserit
 multiplica
 per 60
 & divide
 per idem quod
 prius
 numerus quotiens
 erunt secunda
 diei

in sequentibus tabellis anni plerique illustratis exprimitur, in quibus celeberrae sunt, sicutque
 conuinctiones trium superiorum secundum medios motus.

CONIUNCTIONES α β γ post Christi incarnationem
 supputatae secundum medios motus.

anum tuū velis reducere illud tēpus, quia forſan tibi habitas: cognosce tēps diffinitū meridiani loci tui à meridiano Tolcei. Et ſi meridianus loci tui fuerit orientalior meridiano noſtro, illud addas ad tēps cōiunctionis & oppoſitionis &c. p. noſtras tabulas inueniſti. Si vero occidentalior, iſtam ſubtrahas, & habebis iſtas cōiunctiones & oppoſitiones ad meridianū tuę regionis.

Verū locum Solis & Lunę hora medię cōiunctionis cuiuſcunq; & oppoſitionis inuenire.

SCias argumentū Solis, cum quo intratabulę equationis Solis, & repias verū locū Solis. Verū autē locum Lunę habebis querendo argumentū Lunę in tabula equationū Lunę, & in directo inuenies equationem argumentū ſuis titulis adde vel minue, ſi cum argumento non ſint minuta. Si vero cum argumento ſint minuta, fac pro illis partem proportionalem, hanc equationem adde vel ſubtraha ſecundum quod tituli admonent, à medio motu, & provenit verus motus Lunę. In tempore enim cōiunctionis vel oppoſitionis profacienda equatione Lunę non ingredimur cum eius centro quia equatio generi nulls eſt. Nec enim accipimus diuerſitatem diametri circuli brevis: quia minuta proportionalia nulla ſunt, ſed tantum cum equatione argumenti operamur, & habebimus propoſitum.

Duodecimam partem diſtantię inter Solē & Lunam inuenire, vt fieri oportet in æquando conſtinctiones & oppoſitiones Solis & Lunę veras.

CVM gradibus diſtantię eorum intra tabellam diſtantię primam, ſec. &c. & ſibi inuenta extra nota. Deinde cum minutis diſtantię intra tabellam ſecundam diſtantię, &c. & quod ibi inuenieris ex minutis & ſecundis, ſub primis ſcribe: quod ſi in diſtantiā fuerit 1. intra tertiam eodē tabulam minuto eum: & quod ibi inuenieris, ſub primis inuenientis poſe, ita tamē q̄ minuta ſub ſecundis ponamur. Quod vero ex eorum aggregatione prouenerit, erit duodecima pars diſtantię inter Solē & Lunam.

Motū ſolis & lunę diuerſū in vno die, vel in vno minuto diei, vel in vna hora inuenire.

IN ſcōto vero loco Solis & Lunę, vt ſupra hora medię cōiunctionis vel oppoſitionis vide diſtantiā, id eſt, longitudo inter verū locū vniuſq; ſubtrahēdo minore à maiori, & quod remanet, eſt longitudo. Et vide cuius ſit longitudo, eſt enim eius qui præceſſerit alterum in ordine ſignorum eſt tunc talis longitudo eſt Solis, ſi Luna nōdum cōſecuta eſt Solē in cōiunctione, vel nadir Solis in oppoſitione. Vel eſt Lunę, ſi Luna iam tranſiit ſolem in cōiunctione vel nadir ſolis in oppoſitione. Hanc ergo longitudinem ſerua, & ſcribe iuxta longitudo Solis vel Lunę, ſecundū qd̄ oportet. Cuius longitudo accipe duodecimā partē, & ipſam eiūſ longitudo addde: & illius totius partitudo ipſum in dno medio accipe medietate, & eam cum argumento medio Lunę cum quo inueniſti eius verū locum, adige, ſi fuerit longitudo Solis. Vel ab eo minue, ſi fuerit longitudo Lunę: & quod prouenerit, erit argumentum Lunę æquū pro inueniēdo motū lunę æquū in vno minuto diei, vel in vna hora, ſi volueris forte opari p̄ horas &c. & ſerua ipſum. Deinde intra cum argumentū Solis in tabulę motū diuerſi ſolis in vno minuto diei, ſi volueris opari per minuta diei &c. quęredo ſigna in ſuperiori parte tabulę præſentationis & gradus in linea longitudinali quę deſcendēdo augmentatur: & qd̄ in eius directo inuenieris, de motū ſolis diuerſo accipe, ſi ſciſ: poteris eum inuenire, quia eſt motus ſolis in vno minuto diei æquus. Si vero non præciſe inuenias eū, fac partē proportionale deinde eodē modo intra cum argumentū lunę cum ipſo addito ſeu dimiſto ſerua, ſi præciſe poteris ipſum inuenire: Si vero non, fac partē proportionale, & quod in eius directo inuenias, eſt motus lunę diuerſus in vno minuto diei. Si vero (quæ forte operaris per horas) motū ſolis & lunę in hora volueris inuenire, reſolue ſigna argumentorum ſolis vel lunę in ſigna cōmunita, & cum illis intra tabellam motū diuerſi in vna hora inueniat, eodē modo operādo vt iam feciſti in tabula motus in vno minuto diei, ſemp̄ faciēdo

T partem

partem proportionalem, si opus fuerit & habebis motum diuersum in vna hora: quo medifere inuenias horam veram coniunctionis vel oppositionis. ¶ Et nota hic, quia licet per istum modum possis inuenire motum solis in vno minuto diei, vel in vna hora, si quocumq; loco eccentrice sui sit sol: tamen motus lunæ in vno minuto diei, vel in vna hora per istas tabulas inuenies solis quodammodo epicycli lunæ est in auge eccentrice sui: quod est hora coniunctionis vel oppositionis solis & lunæ. Si autem velis motum lunæ in vno minuto diei, vel in vna hora vbiuisq; fuerit in suo eccentrico, verum loci lunæ ad tempus, proportionem inuenias deinde ad vnum minutum diei, vel ad vnum horam post tempus proportionem iterum inuenias locum lunæ verum. Et tunc subtrahere primum à secundo, & quod remanet, est motus lunæ in vno minuto diei, vel in vna hora, secundum quod operatus es. Cōsimiliter possit fieri de sole, subtrahendo eius motum verum primum habitum à vero motu ipsum secundum habitum, & remanens erit certior eius in vno minuto diei, vel in vna hora motus. ¶ Item nota quod per cōsimilem modum poteris inuenire motum coram æquatum in vno die, scilicet primum quærendo veram loca earum ad istos considerationis tue, deinde ad vnum diem post, & tunc subtrahendo primum à secundo, & habebis motum eorum in vno die æquatum sine verum.

¶ Tempus igitur coniunctionis & oppositionis vere Solis & Lunæ ex supradictis si vis inuenire.

Scias tempus medie coniunctionis vel oppositionis eorum, et super deinde scias verum locum solis & lunæ hora medie coniunctionis, vel hora verisq; hora medie oppositionis, et super & vniuersaq; eorundem serua. Deinde vide si verus locus lunæ sit in eodem gradu & minuto atq; secundo, in quo verus locus solis tunc coniunctio vera & media sunt in eodem tempore puncto. Vel si verus locus lunæ sit etiam in eodem gradu & minuto & secundo in quo est verus solis tunc oppositio vera & media sunt in eodem tempore. Deinde si sol & luna non fuerint in eodem loco tunc cognito motu solis & lunæ supposito in vno minuto diei, et super deinde motum solis in vno minuto diei subtrahere motum lunæ in vno minuto diei; & quod remanebit dicatur separatio lunæ in vno minuto diei. Postea vide quot sunt gradus longitudo inaequalitatis solis & lunæ. Deinde separationem adde pro quotlibet gradu longitudinis (vno gradu amoto) vnam secundum pro quotlibet minuto vnam tertium, &c. hoc est dicere, si superando fuerit 5, adde ad separationem tot & minus vno, id est quatuor & hoc si long fuerit in inferiori parte sui epicycli, id est, si argumenti æquati lunæ fuerit plus tribus digitis vel subtrahe, si fuerit in superiori parte sui epicycli, id est, si argumenti æquati lunæ fuerit minus tribus digitis & quod post additionem vel subtractionem prouenierit, erit separatio æquata, & est temus.

¶ Quo facto reduc totam longitudinem ad eandem denominationem, scilicet ad 1. vel 3. &c. reduc etiam separationem ad eandem denominationem, scilicet ad 1. vel 3. &c. Quibus facto diuide longitudinem per separationem, & quod prouenierit in numero quotiente, erit minuta diuersimode ea ad partem. Et si aliquid remanserit post diuisionem, multiplica illud per 60. & diuide per idem quod prius, scilicet per separationem, & numerus quotiens erit 1. diuerum: & pone ea post minuta diuerum prius seruata. Et si aliquid remanserit post diuisionem, multiplica iterum per 60. & diuide per idem quod prius: & numerus quotiens erit 3. diuerum. Et si adhuc remanserit aliquid, multiplica illud iterum per 60. & diuide eum per idem quod prius: & numerus quotiens erit 1. diuerum, & sufficit. Si tamen forte longitudo dicta esset minor quam separatio, multiplica longitudinem per 60. & postea diuide per separationem, & erunt 1. diuerum: & si fuerit aliquid residuum, operare ut uno super. Quibus expeditis minuta & 1. diuerum &c. que inuenisti per diuisiones adde eam tempore medie coniunctionis vel oppositionis, & hoc si longitudo fuerit solis. Vel ea subtrahere à tempore medie coniunctionis vel oppositionis, si longitudo fuerit lunæ: & quod post additionem vel subtractionem prouenierit, erit tempus vere coniunctionis, si operatus es de coniunctione: aut vere oppositionis, vel valde propinquum, si operatus es de oppositione. Deinde ad istud tempus quære medium motum solis, & medium motum lunæ, & argumentum medium lunæ &

solis, & aqua solem & lunam secundum eandem precisionem qua poteris: & si concordaverint in signis gradibus & minutis, sufficit tibi. Si vero non concordaverint, subtrahere minorem de maiori, & remanebit longitudo, quam serua. Deinde super modum motu solis, quem hunc vicino habuisti, adde motum solis in uno secundo diei, & iterum super argumentum, & aqua solem, ut prius. Quo facto ad motu solis nunc inuenio subtrahere motum solis prius inuentum, & quod proceuerit erit motus solis in uno secundo diei. Similiter facies de luna, si licet aqua eam per unum secundum diei post tempus ad quod equasti eam, & subtrahere primum a secundo, & habebis motum eius in uno secundo diei. Quo facto subtrahere motum solis in uno secundo diei ad motu lunae in uno secundo diei, & proenit superius per quem distinde longitudinem, & numerus quotiens erit a diebus: & si quod remansit, multiplica p 60. & diuis de p idē qd prius, & erit s. dicitur: & sic quatuordecim. Simile est si p motu solis & lunae in hora operis p omissis qd restatis est horae & operis fractiones hor. Quo pacto tps istius distionis adde sup tps vere obductionis peris inuenit, si vicina longitudo fuerit solis: vel subtrahere, si fuerit lunae: qd post additionē vel subtractionē proceuerit, aut tps vere obductionis diei non erit. Ad quod tūc quere locū solis & lunae, utriq; scilicet equido, & videbis ppositum.

Sed quia modus iste inueniendi tempus obductionis vel oppositionis verum tam distans, licet sit praeter ceteros maioris veritatis, tamē quia laboriosus multo, maxime non exercitatus qui agitur vellet breuiter & expeditius tempus inter medium obductionem & veram inuenire, posset operari hoc modo. Habito tēpore medae conuentionis vel oppositionis, & ad illud tempus veram lineam solis & lunae: & deinde eorum motu in vna hora p praecedenti inuenio, & per modum iam dictum super habes longitudo & superatione p quata & serua, cum gradibus tantū longitudinis & minutis tantū superationis intra quae inferrietur tabula inuentionis tēpore inter conuentionē vel oppositionē mediā & verā, & horas & fractiones in angulo communi gradibus longitudinis in latere tabulae inuenti & minutis superationis in capite tabulae inuenti accipe. Accipe etiam differentiam scriptū versus dextram, & omnia scribe ad partem. Deinde cum minutis longitudo intra tabulam quae inferrietur Tabula inueniendi tempus inter conuentionem vel oppositionem mediam & veram in linea laterali descendente & cum minutis superationis in capite tabulae & minuta & secunda quae in angulo communi inuenti accipis: & si intrando cum minutis longitudinis in dicta tabula habueris me minuta longitudinis, p ea non possis praecise inuenire, intra primū conuenero maiori propinquiori in tabula reperas, deinde cum residuo & minuta & secunda quae inuenit, adde horas & fractionibus quae prius inuenit, & serua. Deinde cum minutis longitudinis inuenit intrandam tabulam, & cum differentia scripta in capite tabulae in latere minorum superationis, cum quibus intrasti ad minuta & secunda quae in angulo communi inuenti, adde differentia quam scripsisti ad partem secunda accipe partem proportionalē huius aggregati secundum proportionem fractionum quae habes in superatione ultra minuta, ad 60. & hoc facies cum tabula tabularum ad omnes calculationes. Et quod proceuerit subtrahere ab horis & fractionibus quae deservunt, & proceuerit tibi tēpus inter conuentionem vel oppositionem mediam & veram quod adde ad tempus medie obductionis vel oppositionis, si longitudo fuerit solis vel nadir eius, vel subtrahere, si longitudo fuerit lunae, & proceuerit tibi tēpus vere obductionis vel vere oppositionis: debus non equatis, vel valde propinquum. Si vero sine omni scrupulo sufficit velles inuenire tempus vere obductionis vel vere oppositionis, ad tempus ita inuentum quare loca vera solis & lunae, & si sint in eodem loco vel locis directē opposit, habes usum: si vero fuerint in diuersis locis, inter longitudo & motu solis & lunae in hora & superatione inuenti, ut supra, & per modum dicti opere, & proceuerit tibi tēpus verū me obductionis vel oppositionis de quodlibet, operari ea, & ad illud tēpus debentur quare loca vera solis & lunae, si fuerint opus.

Semidiametrum Solis & Lunæ & circuli umbre in loco transitus Lunæ invenire.

p. 178

CVM argumento solis mediante quo inuenisti eius equationem hora vera coniunctio-
nis vel oppositiōis intra tabulam que intitulatur Tabula ad inueniendum semidia-
metros Solis & Lunæ &c. & in directo inuenies semidiametrum solis sub suo titulo.

Eodem modo eam argumento lunæ intra eandem tabulam, & in directo habebis semidia-
metrum lunæ, & semidiametri umbre, quodlibet sub suo titulo & intra temp. cum duplici
interitū, si oportet. Sed nota quod semidiameter umbre hic posita supponit solem esse in
auge sui eocentri, & sic non haberes semidiametrum umbre per illum modum, nisi qui-
do sol est in augeitū est, quando nullum est argumentum solis. Si autem sol fuerit alibi ☉
in auge, tunc cum argumento solis intra eandem tabulam, & accipe illud quod est in dire-
cta linea, que intitulatur Variatio umbre: & intra illa, si oportet, & illud quod prouenit,
subtrahit à semidiametro genis inuenta, & remanet semidiameter umbre equata ad locū
solis seu distantiam.

Possibilitatem necessitatemq. eclipsis inuenire.

Possibilitatis igitur eclipsis solaris tempore coniunctio-
nis, vel lunaris tempore oppositiōis
his modis inuenitur. Inuenio tempore verissime coniunctio-
nis vel oppositiōis: vel (ut plures volum) tempore tantum medie coniunctio-
nis vel medie oppositiōis, que ut ad illud tempus argumentum latitudinis lunæ equatum: vel secundum alios
argumentum latitudinis lunæ medium indifferentem quodcumque libuerit. Quo inuenio si
reperitur signum 0. & minus 6. 1. 2. vel sign. 7. & plus 8. 4. 8. vel sign. 1. & minus 6. 1. 2. vel
1. & plus 8. 4. 8. die eclipsim fore possibilem solarem, scilicet si operatus fueris ad tempus cō-
iunctio-
nis & lunarem, si operatus fueris ad tempus oppositiōis. Si autem extra istos termi-
nos reperitur, dicunt eclipsim fore impossibilem. Alii tamen ad hoc inuestigandum ope-
rantur cum vera coniunctio-
nis, vel cum vera oppositiōe, ad illud scilicet tempus inuenien-
do argumentum equatum latitudinis lunæ, & ad omnia ultra operando ut supra. Potest ergo
quocumque istorum modorum ad libitum operari sed consilio tibi, ut omnibus his modis ope-
reris, antequam dicas aliquam eclipsim fore impossibilem. Nam si omnes hi modi fuerint
concordes in impossibilitate eclipsis, dic libere & secunde eclipsim fore impossibilem, & ali-
ter non. Et si vnus solus horum modorum dicit tibi possibilitatem eclipsis, dic libere & se-
cunde eclipsim fore possibilem. Et sic apparet, quod ad negotiationem eclipsis omnes hi modi
concurrunt, & ad affirmationem eiusdem vnus solus horum modorum sufficit. Sed tamen
quia saepe reperitur possibilitas eclipsis alicuius per argumentum latitudinis lunæ, quando
tamen non accessitas est herieclipsim, Regula Albategni de necessitate eclipsis ☉. ☽ In
primis inueniantur semidiameter solis, & semidiameter lunæ tempore verissime coniunctio-
nis, & aggregentur simul. Et ad idem tempus inueniantur latitudo lunæ vltra, & tunc si latitudo
lunæ vltra fuerit equalis aggregato ex semidiametris solis & lunæ, transibit luna prope solē,
& non eclipsabitur sol. Et si latitudo lunæ fuerit maior, impossibile est fieri eclipsim solis.
Sed si latitudo fuerit minor quam aggregatam ex semidiametris, necessitas fit eclipsis solis.
Nota etiam quod si latitudinem lunæ vltimam non inuenieris in aliqua tabularum eclipsis so-
laris, non eclipsabitur sol. Si verò eam inuenieris in dicitur tabularum, vel in ambabus, ne-
cessitas eclipsabitur.

Necessitatem

Compara latitudinem longae ad aggregatam ex duabus semidiametris umbræ & lunæ tunc si latitudo lunæ fuerit maior quam aggregatum ex dictis duabus semidiametris, impossibile est fieri eclipsim. Si autem latitudo lunæ fuerit æqualis tali aggregato, transitur luna prope terminos umbræ, & non eclipsabitur. Sed si latitudo fuerit minor isto aggregato ex semidiametris, necessarius luna eclipsabitur. Si latitudo tempore verissime oppositionis non invenitur in aliqua tabularum eclipsis lunæ, impossibile est fieri eclipsim lunæ. Si vero invenitur in altera earum vel in ambabus, necessarius fit eclipsis lunæ. Notandum quoddam tabulæ, quibus hæc veritas, de diversitate aspectus lunæ in longitudine & latitudine sunt facta luna existente in auge sui deferentis & etiam in auge sui epicycli, & cum hoc in principio cuiuslibet signi, ergo si luna non fuerit in istis locis, tunc oportet te æquare diversitatem aspectus pro loco zodiaci, & etiam pro loco epicycli & eccentrici in quo est luna. Nota etiam quod diversitas aspectus lunæ posita in tabula non est tota diversitas aspectus eius, sed est residuum manens post subtractionem diversitatis aspectus solis à diversitate aspectus lunæ, & proprie vocatur hæc diversitas aspectus lunæ ad solem.

Cum igitur volueris scire diversitatem aspectus.

Scias primo tempus verissime conjunctionis diebus non æquatis: & ad idem tempus scias verum locum solis & lunæ, argumentum verum latitudinis lunæ: & hoc vocatur argumentum latitudinis lune secundo æquatum, quia argumentum latitudinis lune primo æquatum esset argumentum latitudinis æquatum ad tempus medie conjunctionis. Sed etiam ad tempus productum motum lunæ in hora una acceptum per argumentum æquatum lune mediante quo invenisti æquationem argumenti tempore verissime conjunctionis. Et scias similiter motum solis in una hora per argumentum solis, mediante quo eodem tempore invenisti æquationem solis. Et similiter scias superationem lunæ in una hora. Deinde cum vero loco solis quære æquationem dierum cum nobis suis, quam adde tempori verissime conjunctionis diebus non æquatis. Et tunc ad idem tempus scias gradum ascendentem, & gradum medii caeli, & etiam ascensiones gradus solis & lunæ, & ascensiones gradus ascendentis, & gradus medii caeli in horizonte recto. **¶** Quibus habitis scias verum luna tempore verissime conjunctionis diebus æquatis sit supra terram, aut sub terra, & quid sit, utrum hora istius conjunctionis sit in die vel in nocte. Si vero fuerit sub terra, hoc est, si conjunctio fuerit in nocte, nihil carere de ea quæ eclipsim non erit visibiles, & maxime si fuerit profunda in nocte: potest tamen esse parum post ortum solis, vel parum post occasum, quæ aliqua pars eclipsis videretur. Si autem luna tempore conjunctionis fuerit supra terram, scias an ista conjunctio sit ante meridiem, vel post. Si enim luna fuerit inter ascendens & medium caeli, hæc est, quando inter gradum ascendentem & locum lunæ sunt pauciores gradus quam 90. **¶** tunc conjunctio est ante meridiem. Si vero luna est inter occidentem & medium caeli, hoc est, si inter gradum ascendentem & locum lunæ sunt plures gradus quam 90. tunc conjunctio est post meridiem. Postea scias distantiam conjunctionis à meridie per horas æquales isto modo. Subtrahat horas & minuta tempore verissime conjunctionis diebus æquatis à 24. horis, & hoc si illæ horæ conjunctionis fuerint plures quam 12. & remaneant horæ distantie conjunctionis à meridie, & sunt ante meridiem diei sequentis. Si vero horæ conjunctionis fuerint pauciores quam 12. serva eas pro distantia conjunctionis à meridie, & sunt post meridiem eiusdem diei. **¶** Habitis ergo horam distantie vere conjunctionis à meridie, intra eam cis tabulam diversitatis aspectus lunæ, quæ facta sit ad eam climam vel quæ sit pro prior latitudinē tuæ regionis, & intra sub signo in quo est sol, & hoc in parte super-

riori,

perion, scilicet ante recessum, si coniunctio fuerit ante meridiem vel in parte inferiori, que intrinsecus recessus, si coniunctio fuerit post meridiem. Accipe igitur minuta longitudinis in directo istarum horarum inuenta, & habebis diversitatem aspectus lune in longitudine, si cum horis non fuerint minuta. Si vero cum horis fuerint minuta, intra iterum eadem tabulas una hora superaddita, & accipe in directo minuta longitudinis ut prius, & scribe ea extra sub alio. Deinde scias differentiam inter minuta longitudinis nunc accepta & prius accepta. De qua & aliarum fractionum que sunt ultra horas perfectas accipe partem proportionalem ad 60. minuta. Quam partem proportionalem adde minus longitudinis primo accepta, si minuta secundo accepta fuerint plura minutis primo acceptis: Vel subtrahere ab eis, si fuerint pauca: & proveniet diversitas aspectus lune in longitudine aequata supposito quod luna sit in principio signi sub quo intrasti, & etiam in auge epicycli & eccentrica. Si vero luna non fuerit in locis predictis, tunc minuta longitudinis nunc inuenta vocantur, Diversitas aspectus in longitudine aequata pro horis tantum, hoc est pro horis distantie conjunctionis à meridie: & tunc oportet te equare diversitatem aspectus istam pro zodiaco eccentrico & epicyclo.

¶ Primum si luna non fuerit in principio signi, tunc etiam intra sub sequenti signo cum horis distantie conjunctionis à meridie, & in eadem parte tabule accipe minuta longitudinis in directo inuenta, & aequa etiam pro minutis horae, & habebis diversitatem aspectus in longitudine aequatam pro horis & minutis in principio signi sequentis illud signum in quo est luna.

Deinde considera differentiam inter minuta longitudinis aequata pro horis & minutis signi in quo est luna, & eius signi sequentis: subtrahendo numerum minore à maiori: de qua differentia accipe partem proportionalem secundum proportionem gradus & minorum, & aliarum fractionum signi in quo est luna pertransitorum, ad totum signum, id est ad 30. ¶ Quam partem proportionalem adde ad diversitatem aspectus aequatam pro primo signo, si diversitas aspectus pro secundo signo aequata fuerit maior: vel subtrahere eam à prima, si secunda fuerit minor. Et quod post additionem vel subtractionem proveniet, est diversitas aspectus aequata pro horis & minutis, & pro loco lune in zodiaco.

¶ Deinde si luna non fuerit in auge epicycli, hoc est quidam argumentum aequatum lune fuerit aliquid in signis aut gradibus & minutis, tunc diversitatem aspectus iam inuenta oportet te equare pro reuocacione lune ab auge epicycli isto modo. ¶ Cum argumento hanc aequato hora vtriusque conjunctionis diebus non equatis intra tabulæ aequationis diversitatis aspectus: & si tale argumentum ibi per se inuenis, accipe in directo minuta proportionalia in linea super quam est scriptus Epicyclus. Si vero tunc argumentum non precise inuenis, intra primum cum numero minori propinquiori in tabula scripto: & accipe in directo minuta proportionalia, sicut dictum est. Deinde intra cum maiori numero immediati ibidem inuento, & accipe etiam minuta proportionalia in directo eadem. Deinde scias differentiam illorum minorum proportionalium subtrahendo numerum minore minorum de maiori: de qua differentia accipe partem proportionalem secundum proportionem gradus & fractionum in argumento aequato contentorum ultra signa & gradus eum quibus primum intra si ad 6. ¶ Quam partem proportionalem adde minutis primo acceptis, si minuta secundo accepta fuerint plura minutis primo acceptis: vel subtrahere ab eis si fuerint pauca: & tunc post additionem vel subtractionem habebis minuta proportionalia aequata, secundu quorum proportionem ad 60. accipe partem proportionalem de minutis diversitatis aspectus in longitudine vltimo aequatis. Pro zodiaco. Que pars proportionalis ostendit quantum diversitas aspectus sit augmentata propter deflectionem lune in epicyclo: quam adde diversitati aspectus prius inuenta, & habebis diversitatem aspectus tribus modis aequatam. p. horis & minutis, & pro loco lune in signo in quo est, & pro loco eius in epicyclo. ¶ Si luna non fuerit

in auge eccentrici. **Quod** scies isto modo. Si nullum fuerit ceterum modum hanc hora verif-
 ficat obumbrationis diebus non equatis, tunc in eodē tempore luna est in auge sui eccentrici. &
 hoc est quando obumbratio media est eadē cum obumbratione vera. Si vero ceterum mediū fue-
 rit aliquid in gradibus & minutis, tunc luna non est in auge. Tunc oportet te equare pro
 eccentricitate centro medio lunę intra tabulę equationis diuersitatis aspectus, & intra
 cum dupli introitu, si oportet, id est, si centri medium non præcis inuenieris; & accipe mi-
 nuta proportionalia in directo existentia in linea quę intulatur Eccentricus, secundū quo-
 rum proportionem ad 60. minuta, accipe partem proportionalem de diuersitate aspectus
 lunę vltimo inuenta, scilicet equata pro epicyclo. Et illa pars proportionalis ostēdit quantū
 augmētatur diuersitas aspectus propter descensum epicycli lunę ab auge eccentrici. Quam
 adde diuersitati aspectus in longitudine vltimo inuentę, puenit diuersitas aspectus in longi-
 tudine omnibus modis equata; scilicet pro horis & minutis, pro zodiaco, epicyclo, & eccen-
 trico. Et nota si cum argumento equato lunę nihil inuenies in minutis proportionalibus
 in tabula equationis diuersitatis aspectus, tunc diuersitas aspectus equata pro loco lunę in
 zodiaco, est etiam equata pro epicyclo. Similiter si cum centro medio nihil inuenies de
 minutis proportionalibus, & hoc semper in sua linea, sicut dictum est, tunc diuersitas aspe-
 ctus equata pro epicyclo est etiam equata pro eccentrico. **Tabula** igitur diuersitate aspectus in
 longitudine orbis modis equata, reduc eam ad eandē denominationē, scilicet ad secūda &c.
 Reduc etiā superationē lunę in via hora ad eandē & tunc diuide diuersitatem aspectus per
 superationem, & in quotiente proueniunt horę. Si vero diuersitas aspectus fuerit ita parua
 quę non possit diuidi per superationem lunę, tunc multiplica eam per 60. & postea diuide
 productum per superationem, & prouenit in quotiente minuta horę. Et si fuerit aliquid res-
 siduum, illud multiplica iterum per 60. & diuide per idem quod prius, & pueniet fractio
 immedie sequens. Et tunc tempus illo modo proueniens vocatur **Horę primę diuersitatis**
aspectus. Quas adde horis verę conjunctionis diebus equatis, si inter gradum ascendētē &
 locū lunę fuerint plures gradus quę 90. hoc est quando coniunctio fuerit post meridiem. Vel
 subtrahē illas horas diuersitatis aspectus ab horis verę conjunctionis diebus equatis, si inter
 gradum ascendētē & locum lunę fuerint pauciores gradus quę 90. hoc est, si coniunctio ve-
 ra diebus equatis fuerit ante meridiem. Quo facto scias etiam distantiam illarum horarū
 quę post additionem vel subtrahationem proueniunt, à linea meridiana; & illę vocantur **horę**
secundę distantē à meridie. Cum quibus quęre diuersitatem aspectus in longitu dine, recte
 per eundem modum sicut prius fecisti, quando scilicet pro horis & minutis, & loco lunę in
 zodiaco, epicyclo, & eccentrico. Et vocatur **diuersitas aspectus secūda.** Quę etiā diuide p super-
 ationem lunę in via hora, eodē modo vt prius. Et tunc horę, minutis & secundis quę proue-
 niūt, vocantur **horę secundę diuersitatis aspectus;** quas adde horis verę conjunctionis diebus
 equatis, scilicet horis quibus addidisti horas primę diuersitatis (& non aggregato ex horis
 verę conjunctionis, & horis primę diuersitatis). Et hoc si inter locum lunę & gradum ascen-
 dentem fuerint plures gradus quę 90. Vel subtrahē ab eis (scilicet ab horis verę conjunctionis
 & non ab horis quę remanent post subtrahationem horarum primę diuersitatis aspectus
 ab horis verę conjunctionis) & hoc hoc si inter locum lunę & gradum ascendētem fuerint
 pauciores quę 90. G. Deinde illarum horarum quę tibi nunc post additionem vel subtrahationem
 proueniunt, etiam scias longitudinem à linea meridiana, sicut prius; quę vocantur
 hoc tertie distantē à meridie. Et cum illis iterum quęre diuersitatem aspectus in longitu-
 dine, eodem modo operando sicut prius; & hoc erit **diuersitas aspectus tertia.** Deinde cō-
 sidera an ista diuersitas aspectus tertia sit maior secūda aut minor, aut par. Si par, es expedi-
 ditus; quia tunc secūda diuersitas aspectus fuit equata & verum cum cuius horis procedi, vt

intra p[er]hibet, quia ipse sunt horae mediae eclipsis. Quia tunc quantitas diversitatis aspectus lunae in longitudine erit aequalis minutis quae sunt inter solem & lunam eadem hora. Si vero diversitas aspectus tertia sit maior secunda, tunc diversitas aspectus ista hora erit maior minutis quae sunt inter solem & lunam tantum quantum diversitas tertia excedit secundam. Si autem diversitas tertia sit minor quibus secundam, tunc diversitas aspectus eadem hora erit minor minutis quae sunt inter solem & lunam, tantum quantum diversitas secunda excedit tertiam. Quare oportet te equare, & quere horam in qua diversitas aspectus in longitudine sit aequalis minutis inter solem & lunam eadem horae quia in ipso erit medium eclipsis & hoc fac illo modo. Si diversitas aspectus tertia fuerit maior secunda, scies quanto superet eam, & serva differentiam. Et tunc si longitudo lunae ab ascendente fuerit minor 90. g. tunc ex minutis horarum tertiae distantiae consuetudinis a meridie, quae per secundam distantiam aspectus invenisti q[uod] est, ex minutis horae, quae sequuntur horam completam, subtrahes sextam partem vnius horae, si potest hoc est, si sunt tot minuta horae ultra horam completam, quae sunt ab eis subtrahi sexta pars horae, id est 10. minuta. Si vero ex illis minutis non potest subtrahere sextam partem vnius horae, tunc subtrahes octavam, id est 7.5. & i. 30. vel decimam partem, id est 6. & sic de aliis, prout melius poteris, ita ut horam integram non frangas. Si vero longitudo lunae ab ascendente fuerit plus 90. g. tunc adde sextam partem horae, aut octavam, vel decimam, minutis quae sunt ultra horam completam tertiae distantiae, tamen quoniam non addas tantum, ut perfectam integram horam. Et eius quod post additionem vel subtractionem provenit, quere diversitatem aspectus in longitudine quartana & vide quantum illa quartae excedat tertiam, vel i. conuenit, & ubi tunc minorem de maiore. Et tunc illam differentiam tertiae & quartae diversitatum aspectus multiplica per 6. si addidisti vel subtraxisti sextam partem vnius horae. Vel per 8. si addidisti vel subtraxisti octavam partem. Vel per 10. si addidisti vel subtraxisti decimam partem horae & sic de aliis. Et per istam multiplicationem non fit variatio denominacionis. Sicque proveniet diversitas aspectus quae debetur vni horae quae subtrahit a separatione lunae in vna hora, & quod remanet, erit motus lunae equatus per quem dividitur differentia inter secundam & tertiam diversitatis aspectus, primo vtrumq[ue] reducendo ad eandem denominationem, & tunc in numero quotiens proveniant horae. Et si non possit differentia dividi per motum lunae equatum, tunc multiplica per 60. & productum divide per idem quod prius, & provenient in quotiens minuta horae. Et si adhuc non possit dividi, multiplica adhuc per 60. & divide sicut prius, & provenient i. horae. Postea illud quod provenit de horis & minutis, vel de minutis tantum, adde horis secundae diversitatis aspectus, & quod provenient serva, & erunt horae secundae diversitatis aspectus equatae. Si vero diversitas aspectus tertia fuerit minor q[uam] secunda, & si longitudo fuerit minor 90. g. adde sextam partem vnius horae, aut octavam, vel decimam, & sic de aliis, ut melius poteris, ita tamen ut horam integram non expleas. Si fuerit longitudo plus 90. g. subtrahes sextam partem vnius horae, aut octavam, vel decimam, sic tamen quod horam integram non frangas. Et hoc est conueniens eius quod prius habuisti, scilicet quod si diversitas tertia erit maior secunda, tunc eius quod provenient quere diversitatem aspectus in longitudine quartana. Et tunc considerans quod superat quartam a tertia, vel i. diversitas & excessum multiplica per 6. vel 8. vel 10. secundum quod addidisti vel subtraxisti sextam, octavam vel decimam partem horae, sicut prius disti est, & auerens diversitatem aspectus quae debetur vni horae, & tunc huic quod provenient adde separationem lunae in vna hora, & provenient motus lunae equatus per quem divide differentiam inter secundam & tertiam diversitatis aspectus secundam doctrinam eandem disti, & quo i. poteris subtrahere ab horis secunda diversitatis aspectus & provenient horae vnde diversitas aspectus, & serva eas. Hoc autem ratio esset, scilicet quod secunda excedat

Handwritten marginal notes on the left side of the page, including the word 'MARE' and other illegible scribbles.

Handwritten marginal notes below the main text, including the word 'MARE'.

tertiam id est $3p$ tertis sit minor secunda, nisi tunc luna fuerit ppc horizonti: & tunc inter du
 as diversitates differentia minima appropiet. Et hæc est sententia Albategni in diversitate
 aspectus lune pro eclipsi solis inveniendâ, quando diversitas aspectus tertis fuerit maior aut
 minor secunda. Habitis igitur horis secunde diversitatis aspectus æquatis, multiplica eas p
 motum solis in vna hora: & etiam per motum lune in vna hora pro quolibet separatim, &
 ponens tibi serua quodlibet per se: & illa ostendunt quantum sol & luna mouentur in predicti
 etis horis secunde diversitatis aspectus. Et tunc si ligando ab ascendente illa hora fuerit mi
 nor 90 . β predictas horas secunde diversitatis aspectus æquatas subtrahæ ab horis verissime
 coniunctionis diebus æquatis: & provenit coniunctio visibiles, quæ est medium eclipsis, &
 subtrahæ motu solis in minutis horæ, & motum lune in eisdem locis subtrahæ à loco lune
 inuento verissime coniunctionis: Hoc idem subtrahæ ab argumento lune: & proveniant oia
 illa æquata ad medium eclipsis. Deinde hoc idem quod subtraxisti à motu lune, ab argu
 mento lune, subtrahæ etiam ab argumento latitudinis lune secundo æquato, prius servato.
 Deinde vide quantum caput draconis mouetur secundum cursum suum motum in horis secunde
 diversitatis aspectus æquatis, intrado scilicet tabulæ mediæ motus capitis draconis eam horis
 & minutis secunde diversitatis aspectus æquatis, & illi motui etiam subtrahæ ab argumento lati
 tudinis secundo æquato: & provenit argumentum latitudinis tertio æquatum ad medium eclipsis.
 Si vero longitudo lune ab ascendente sit plus 90 . β tunc omnia ista quæ tibi nunc præcep
 i subtrahere à coniunctione vera diebus æquatis, & à vero loco solis, & à vero loco lune, & ab
 argumento lune & ab argumento latitudinis secundo æquato, debet addi eisdem, & provenit
 oia illa vt prius, scilicet tertius motus eclipsis, & locus solis & lune, & argumentum æquatum, & argu
 mentum latitudinis tertio æquatum tempore mediæ eclipsis. Deinde cum argumento latitudi
 nis lune tertio æquato quod nunc inuenisti, intra tabulæ latitudinis lune cum duplici intro
 ita, si oportet, & accipe latitudinẽ lune quam ibi inuenies, & partẽ suam, & serua ad partẽ.
 Deinde scies distantiam horarũ mediæ eclipsis à linea meridiana secundum modum prius di
 stictum quibus horis intra tabulam diversitatis aspectus, & accipe minuta latitudinis in di
 recto inuenta, eodẽ modo procedendo nunc vt prius, scilicet æquando illam diversitatis aspe
 ctus pro horis & minutis, & loco lune in eodẽ tempore mediæ eclipsis, & pro loco lune
 in epicyclo & eccẽtrico. Sed pro epicyclo minuta proportionalia non sunt eodẽ modo quæ
 prius fuerunt quia argumentum æquatum lune non est idẽ ideo oportet te intrare cum argu
 mento lune æquato ad medium eclipsis iam sergato in tabulam equationis diversitatis aspe
 ctus, & accipe minuta proportionalia in directo ipsius inuenta, & inter eam duplici introitu, si
 oportet. Similiter locus lune nõ est idẽ qui prius, ideo oportet te intrare pro loco lune, in
 quo est tempore mediæ eclipsis scilicet, de differentia quæ est inter diversitatem aspectus in
 latitudine inuenta sub signo in quo est luna, & inuenta sub sequenti, accipiendo partẽ pro
 portionalẽ secundum proportiõem graduum & sũmũ fractionum quæ pertransiit luna
 de signo in quo est tempore mediæ eclipsis ad totum signum. In aliis non differt opus, nec
 oportet te istam diversitatem plus æquare quàm semel. Dicitur etiam aspectus in latitudine in
 uenta, vide eius partem, id est verum sit meridionalis vel septentrionalis: & est semp meridio
 nalis in omnibus regionibus quarũ latitudo est maior 24 . β vel quarũ altitudo poli est ma
 ior \bar{q} sit maxima solis declinatio, quæ ponitur maior 5 . 24 . & est idem in sententia. Habito
 isto considera verum diversitatis aspectus in latitudine inuenta, & latitudo lune prius in
 uenta sit in eadem parte, id est si ambe sint meridionales, vel ambe septentrionales: tunc
 iunge eas simul. Latitudinem lune & diversitatis aspectus in latitudine, & provenit latitudo
 lune visã ad medium eclipsis. Si vero vera sit meridionalis, & illa septentrionalis, tunc sub
 trahæ minorem de maiore, & remanebit latitudo lune visã, quæ erit illius partis cuius

accipe, & serua ad partē. Deinde intra tabulam ad longitudinē propiorē; & similiter accipe pūcta eclipsis, & minuta casus quę in directio inuenieris, & sub aliis scribe, quodlibet sub suo genere. Et si latitudinē lunę visam in aliqua predictarum tabularum aut in ambabus non inuenieris præciū pūctis intra eū duplici introitu: & sic cōsequenter ut prius dictū est. Deinde subtrahē numerum minorē punctorum de maiorē similiter numerum minorē minorū casus ad maiorē; & differentiam punctōrū serua per se, similiter & differentiam minorum casus. Deinde eū argumento lunę æquato ad mediū eclipsis intra tabulā æquationis diuersificat; aspectus antiam per 6. p. & accipe minuta proportionalia quę in directio inuenieris ut prius. Postea de quolibet differentia, si licet tam punctōrū quā minorum casus accipe partē proportionalem, secundū proportionem minorum proportionaliū iam inuentōrū ad 60. h. ut prius; & quod inde puenit ex pūctis, adde puncta acceptis in tabula longitudinis Regioris; & quod ex minutis casus puenit, adde minutis casus acceptis ex eadem tabula longitudinis Regioris. Et quę puenierint post augmentū, erūt puncta eclipsis & minuta casus æquata ad locū lunę in epicyclo. Habitu igitur punctis eclipsis & minutis casus æquatis ad locum lunę in epicyclo secundum aliquem predictorum modorum.

Si vis scire principium, finem & durationem eclipsis.

TUNC minuta casus æquata ad locum conjunctionis diuide per superationem lunę in una hora secundū modū sepe dictū, scilicet reducendo utrumq; ad eandem denotationē & postea diuidendo, & tunc in quotiente pueniet hęc. Et si aliquid fuerit residuū; vel si minuta casus redacta ad denotationē ad quam superatio lunę est redacta, non potest diuidi per superationē tunc multiplica ea p 60. & post diuidē & pueniet minuta hęc, & residuū iterū multiplica per 60. & diuide p idē qd prius, & pueniunt hęc. Et tūc habebis horas, minuta & s. quę sunt inter principii eclipsis & mediū, vel inter mediū & finē. Quas horas, minuta & s. subtrahē a tempore mediū eclipsis, & pueniet principii eclipsis. Et easdē horas & c. adde tēpori mediū eclipsis, & pueniet finis eclipsis. Et easdē dupla, & habebis totam durationem eclipsis. Deinde easdē horas quę sūt inter principii & mediū eclipsis, mediū & finem, multiplica per motū solis in una hora, & productū ostendit quantum sol mouetur a principio eclipsis vsq; ad mediū, vel a medio vsq; ad finem; & illud subtrahē a vero loco solis inuenio tempore visibilis conjunctionis seu mediū eclipsis, & pueniet verus locus solis in principio eclipsis; & idem adde vero loco solis tempore mediū eclipsis, & pueniet verus locus solis in fine eclipsis. Postea easdē horas quę sūt a principio eclipsis vsq; ad mediū, multiplica per motū lunę in una hora, & quod pueniet subtrahē a vero loco lunę tēpore mediū eclipsis, & idem etiam subtrahē ab augmento latitudinis lunę quartū æquato, & pueniet verus locus lunę, & argumentū latitudinis lunę quartū æquato in principio eclipsis. Et idem adde eidē & pueniet illa ad finem eclipsis æquata. Deinde eū argumento latitudinis lunę quartū æquato in principio eclipsis intra tabulā latitudinis lunę, & inuenies latitudinē lunę in principio eclipsis. Intra etiam eū augmento latitudinis quartū æquato in fine eclipsis in eisdē tabulā, & inuenies latitudinē lunę in fine eclipsis. Et si vis scire quantū obscurabitur a occultabitur de superficie corporis solis quantū ad visū, intra tabulam quantitatē tenebrarū eclipsis, & puncta ibi inuenta compara ad 12. quę sūt se habent puncta ad 12. ita se habet pars eclipsis ad solē, vel ad eius diametru. Vt si essent 6. puncta in diētas solis eclipsarentur 4. tunc una tertia eclipsarentur 3. tunc una quarta si 12. tunc solis diameter eclipsaretur, & sic cōsequenter. Et si argumentū latitudinis quartū æquatum fuerit 1.0. in signis & gradibus vsq; ad 3. signa, eclipsabitur pars septem. si verō fuerit plus 3. signis, eclipsabitur pars meridionalis.

ad medium, si non fuerit mora. Eodem modo minuta moræ diuide per supationem lune in una hora, & proueniet hocce, minuta & 5. vel minuta & 2. Solùm, si non fuerit aliqua hora: quæ sunt ab initio moræ vsque ad mediũ eclipsis: quo factò horas quæ sunt à principio eclipsis vsque ad medium si non habuerit moram, subtrahæ à tẽpore verissimæ oppositionis di-ebus æquatis, & remanebit tempus principii eclipsis. Et si easdem horas addideris ad tẽpore verissimæ oppositionis, proueniet tempus finis eclipsis. Subtrahæ etiam tẽpore quod est à principio moræ vsq; ad mediũ eclipsis à tempore verissimæ oppositionis, & remanebit principium moræ. Et si idem addideris ad tempus verissimæ oppositionis, proueniet finis moræ: & si duplaueris tẽpore quod est à principio eclipsis vsque ad mediũ, proueniet tota duratio eclipsis à principio vsque ad finẽ. Et si duplaueris tẽpore quod est à principio moræ vsq; ad mediũ eclipsis, proueniet tota mora, scilicet quamdiu stat tota luna in vmbra. Deinde horas quæ sũt à principio eclipsis vsque ad medium, multiplica per motum lune in una hora, & quod prouenerit subtrahæ à vero loco lune inuẽto tempore verissimæ oppositionis, & etiam ab argumento latitudinis secundò æquato, & habebis verum locum lune, & argumentum latitudinis æquatam tempore principii eclipsis. Et si illud quod nunc subtraxisti addideris eidem, habebis verum locum lune, & argumentum latitudinis æquatam tempore finis eclipsis. Latitudinem autem lune ad ista tria tempora inuenies lætrando tabulam latitudinis lune cum istis tribus argumentis lune, scilicet in principio, medio & fine eclipsis. His habens, si vis scire quantum de superficie lune eclipsabitur, & pũcta eclipsis fuerint innotis 12. intra ostẽdem tabulam quantitas eclipsis, & in directo eorum intra tabulam secundam, quæ est quantitas eclipsis lune, & quod in directo inuenies est quantitas circuli lanens eclipsata secundum quantitatem 12. pũctorum in circulo lunari contentorum.

Colores eclipsium antequam eueniant cognoscere.

Considera latitudinem hora verissimæ oppositionis vel conjunctionis quæ si fuerit ab 1. minuto in 10. erit eclipsis nigerrima. Si à 10. vsque ad 20. erit nigra habens in se viridinem. Si à 20. vsq; ad 30. erit nigra cõ rubedine. Si à 30. vsque ad 40. erit nigra cõ pallore. Sed si à 40. vsque ad 50. pallida grisea: si 50. vsque ad 60. grisea cum albedine. Est etiam alius modus quem secundum Ioannẽ de Lineriis debes coniungere cum primo modo, donec sciverimus scientiam coloris. Et iste est scilicet quod consideretur distantia lune ab auge epicycli: Quæ si fuerit .3. signa vel propè, erit eclipsis nigerrima. Et si fuerit 2. signa & 30. grad. vel 3. signa & 30. grad. erit nigra cum viriditate. Si fuerit 2. vel 4. signa, erit nigra cum rubedine. Et si fuerit vnum & dimidium, vel 4. & dimidium, erit nigra cum pallore. Et si fuerit 1. vel 5. erit grisea. Si autem fuerit 30. ʒ. vel 5. signa & 30. ʒ. erit grisea cum albedine. Et licet Ioannes de Lineriis istud indifferenter dicat de qualibet eclipsi, alii tamen hoc restringunt ad eclipses lune: Alii ponunt differenter de coloribus eclipsis solis & lune, & ponunt talem figuram. Considera distantiam conjunctionis solis & lune à capite vel à cauda draconis in eclipsi solis, & inuenies colorem eclipsis solis in directo nomen distantiam significantis vsque ad 12. & vltra 12. non fit eclipsis. Sed in eclipsi lune considera latitudinem lune, vt patet in tabula inter alias tabulas eclipsium superius descripta.

Luminarium σ aut δ singulis mensibus supputare, γ sequentes *Methodus in bellis.*

Si quispiam per sequentes tabellas factis supputare voluerit luminarium aconemias, hoc est, interlunias, nouilunias, cetera, congregationem copulationemque \odot ac γ , quom Graeci synodon appellant, nos mensuras conuersionis aut pansionem a totuluniam sive plenilunium. Quoddecimas & oppositiones veras luminarium.

ad inueniendos
 Primo scilicet scribas radicem Christi scilicet locum σ & argumentum medi γ locus tunc in duobus locis annotetur vms \odot sibi, alter vero γ peculiaris, cum suis characteribus superne. Sub quibus omnibus seriatim adiciatur omnes numeri e regione annorum collectorum & expansionum reperti. Quam & mensis immediatim praecedentis illi, cuius interlunium aut plenilunium perferatur, dein singulos conuertat ad unicum quodlibet sub suo genere, & congerat illa seruetur ad partem.

1 In tabella que radicem inscribitur, quoniam Christi radicem complectitur, e regione annorum collectorum qui talis pauciores proximiorisque, adiacent, si quid reperies, scilicet scribe. Deim ex directo expansionum ac mensis iam iam elapsi praecedentis, mensem cuius synodum aut plenilunium perferatur. Mox pariter exaggeto quodlibet sub suo genere, veluti arithmetica ratio exigit, & congerat illa seruetur ad partem.

2 Postmodum ex diebus, horis ac M. in tabella interlunium reperis, si σ emeris, aut plenilunium, si δ subducito tunc dies, horas ac M. scilicet seruetur loco antea & argumentum medio adiciatur, & profiliat dies, horae & M. mensis illicet sequentis. In quibus celebrabitur media lunationis σ sive δ quin & MM. vtriusque, cum argumento medio.

3 Ex medio praeterea motu \odot , si argens propriam subduxeris, illic emerget argumenti \odot e regione cuius si locum in γ , si in prima tabella computum conuertueris medio, motum eisdem prius reperto, e vestigio restabit verus locus \odot in zodiaco die & hora mediae σ sive δ . Motum denique \odot in hora ibidem repertam inscribas scilicet.

4 Quarti locum ex directo argumenti medi γ annotatum in γ tabella, si adieceris medio motu, restabit verus locus eiusdem. Quod si congruet in signis G. & M. cum vero loco \odot illa σ sive δ media erit etiam vera. Alioquin motu γ in hora oborto e regione eiusdem argumenti medi, subtrahas motum \odot in hora superius seruatum, & restans ad redactum erit superatio, que diuisionem vicem obtinebit. Deim subducito etiam verum \odot loci i vero loco γ aut e contra, vt pote minor e maiore: & profiliat differentia sine longitudo illius scilicet luminaris, cuius fuerit maior numerus. Huiusmodi differentias ad γ quoque redacti diuide per superationem, vt motu, & profiliat in quotiente horae ac M. Quas adde horis ac M. σ aut δ mediae, si longitudo fuerit \odot aut subtrahes, si γ & confluat tempus verae applicationis seu σ huiusmodi quod quaerabas. Si denique motu vtriusque luminarium in hora multiplicaueris per hor. ac M. ex huiusmodi diuisione copertas: &

productum adieceris vero loco ipsorum, profiliat verus locus luminari in zodiaco adaequatus horis ac M. interlunium sive plenilunium, in futuro Ferrario supputatus. Verum si huiusmodi luminarium applicationes ad alios fines reducere libuerit, Adde vel minus, quod hinc tibi parua tabella nota. Et voti postmodo compos eris.

Augustissimo ac Reueren:
DISSIMO PONT. CARDIN. POMPEIO CO-
LVMNAE L. FELICITATEM.

Vgustissime Principe, Columnae columen, ac vrbis Romae fides fulgentissi-
mum, qui solus nostra hac tempestate magnam Pompeium atque mecenatem
illum clarissimum imitans, quam singulis virtute praeditos semper fouens, &
sub tua umbra admodum frugifera curaris. Octavianus Sfortiade Episcopi
Aretini, olim Laudensis, facti, habente anno Christiano 1500. suppu-
tatis, & ad libellam examinatus atque restitutus in finitore Venetiano 1027.
stellas suas secundum Ptolemaum. Quas praefici Arabes, Chaldaei seu Babylonii, dein Hy-
paeus, Ptolemaeus, & iam tandem Alfonso Hispaniarum Rex in legitudine
tū latitudine obseruatis, eius nomina & ex diuina obseruatione planetarum qualitates
attribuerat & in sex ordines distribuere atque distingere. Quippe qui primae magnitudi-
nis ac luminis, quae regiae & augustae sunt cognominatae, pontifici illi atque cunctos vestri
maiestatis praeseferre videtur. Quae secundi splendoris, caesares coronamque fulgoris ter-
tium, reges; quarti autem ordinis, magnanimos duces ac principes: quinti, patricios atque vr-
bium primates; sexti denique, plebeosalem. Verum primae potissimum ac secunda claritatis
stellas suas si quisquam in eius genitura habuerit in hominibus aut culmine ceteri pariter
collocatas, aut in loco planetarum aphetiorum, id est illegitimum, praecipue luminis con-
ditionari ex ignobili etiam prosapia, humili loco & obdusis parentibus genitum ad cul-
mina rerum & regiam quodammodo potestatem euehant atque extollunt. Stelle enim sua
inquit Ptolem. fixae 29. irrationabiles atque admirabiles felicitates afferunt. Nihil se-
ciliis calamitosum sepius exitum inferunt, & insuauiter finiunt, quae cum luminibus Saturni-
as aut Martias qualitates imitantur, praesertim si eas ita collocatas male, scilicet stellas errantes ho-
stuliter pulsauerint. Tibi vero magnanime Princeps Caesarum stirpe creato quid polli-
ceatur fixarum globos circa Iouem ac venerem & praesepae primi luminis fulgentissimae
cardinales, quibus etiam de medio genethlacus vaticinari poterit. Huiusmodi igitur fixas
stellas, si quisquam habere voluerit supputatis anno hoc scilicet quarto & vigesimo supra ses-
quimilesiarum, singulis suis in 13. seris adiciat. Eodem quoque pacto, si eas in posterum
restituere libuerit. Quotcumque inter nostras obseruationes & sibi oblatos anni fuerint in-
tersesti, toties in singulis harum stellarum longitudinibus adiciat hanc graduum fractionem,
Quae in prima sequenti annotabimus pagella: gradum vero cum fractionibus quamprimum
post nostras supputationes ~~notetur~~ ~~104~~ ~~re~~ ~~centiesimum~~ 109. affuerint anni. In pre-
dictis autem annis subducto, & voti postmodo compos eris.

 Et floepe, meropique simal, formosaque masa.

¶ Has stellas pleiadas seu vergelas (quæ iuxta Ptolemæi doctrinam Lunæ ac Ionis naturas mutantur) qui hora genituræ, cum Luna horoscopantes habuerit, magnus & clarus erit: quæ si Iupiter feliciter in adhaerent, eventum duces, ac terra marique multa geret, demum officio principe bioclanens interbit. Licet autem (ut dictum est) Ionæ naturæ sint, tamen qui eas in occiduo cardine habuerit à maleficiis stellis percussus, naufragus morietur. Quod si beneficæ etiam stellæ illas feliciter intuebantur, nihilominus repentina illi mors ex nimio colen aut inter vina epulæque portenditur. Si quis præterea nascens Lunam in pleiadibus lumine vacillam habuerit à Marte aut ♄, hostiliter percussam, oculis capietur. Pleiades insuper chronice orbantur dum nosser ingeniosus poëta in exiliū deputaretur, quod ipse in libro de Pöto ita commemorat. Ut careo vobis seythicus detrusus in oras, Quinor autumnos pleiads orta facit. Quamquæ Ptolemæus astrologorū facillè princeps, in magno astronomo pleiadibus Lunarem atque Ioniam contraxerat qualitatem, ne Iosephus (quorum semper quoddammodo pleiades calamitosam finem inferre consueverunt) cupiam videretur magis adhibendæ esse fidem Alfonso & de his qui dicere vergelas sibi Martias ac Lunares qualitates videri solent, quæ Ptolemæo atque Pontino. Sed quia non nostrum est tantas componere lites, hæc alius discutienda relinquimus.

¶ **Josephus biffala brixinus poeta. ad I. G. r. i.**

TABVLA SVBSEQUENTES IN PROXIMA EDITIONE DESIDERATAS CVM SVIS CANONIBVSVS OPERAEPRECIVM VISVM

est ad operis integritatem conferendam, in calce restituere: quò
taceam opus omnibus numeris absòlutum præstaremus.

Canones de temporum æque erratum æquatio-
ne, ad sequentes tabulas spectantes.

Canon siue propositio prima.

Tempus quodlibet, & eram quamlibet ex tabulis ad hoc factis extrahi-
re. ¶ Tempus igitur quodcumque siue Bras quæcumq; facillè extrahi-
tur, si prius tabularum earum dispositiones dignoscantur. Sùt itaq; ta-
bularum temporum siue erarum quatuor cõmunes, quarum prima tabula tẽ-
porum siue erarum differẽtiæ, seu differẽtiarum vnius regni ad aliud dõc.
inscripta in ordine primo numerorũ annos Romanos & dies, in secũ-
do verò 47 87 iuxta usum harum tabularum illis æquivalentia in tẽ-
pore cõplectens, differẽtiam eræ cognoscit illius quæ inscriptio è directo verũs deatrd ex-
primat, cõmodissimè declarat hocq; cuilibet ex tabula ipsi erit manifestũ. ¶ Tres reliquæ
tabulæ cõmunes, sũt editæ ad reducendũ annos alicuius eræ ad 47 87 & 7: quarum prima est ad
reducendũ annos solares bifesteriles, quæ an tres dividitur particulares tabellas. Prima earũ
est de annis collectis. Secũda de annis expansis quorũ quartus est bifesterilis. Secũda de
annis expansis, quorũ tertius est bifesterilis. Tertia est de annis expansis, quorũ secundus
est bifesterilis. Tertia verò particularis tabella est de mensibus: & etiam dividitur in tres parti-
culares tabellas. Prima earum est de mensibus incipientibus à Januario. Secũda de mensibus
incipientibus à Octobri. Tertia de mensibus incipientibus à Septembri: & in quilibet
istarum menses bis replicantur: quia superiori vel primo loco ponuntur menses anni non
bifesterilis. Secũdo vel in minori menses anni bifesterilis. ¶ Secũda tabula cõmunitis est ad
reducendũ annos solares non bifesteriles habesq; particulares tabellas quatuor, videlicet
tabellam annorum collectorum, tabellam annorum expansorum, & tabellas duas diversas
mensũ. ¶ Tertia tabula cõmunitis est ad reducendũ annos Arabum, quæ sunt anni luna-
res: quæ etiam habet tabellas quatuor, videlicet duas annorum collectorum: tertã annorũ
expansorum: quartam mensũ Arabum. ¶ Præterea vicinè tabula cõmunitis eris generalis
composita ad hoc, ad reducendũ quasvis eras per annos latinos Alfonso Regis: quæ factũ
dum numerum novem earum in tabellas novem particulares annorũ collectorum dividi-
tur, quæ tabella cõmunitis illis annorum expansorum unã est tabella mensũ bis replica-
torum à Junio Inchoatum. sc. nò bifesterilium superius: inferius autem bifesterilium, subse-
quitur in calce, quæ quidem singula vtrũque tabularum tabellarumq; particulariũ postis in frõ-
te lucè indicet cuiusq; incerti. ¶ Sed lucidioris intelligẽtiæ gratia hæc est animadvertẽ-
tissimũ quòd anni collecti dicuntur hi qui descripti in tabulis p. 20 annos à se invicem distant,
vt in principio tabularum extractiois earum in primo ordine numerosum facillè intelligi
potest: addendo enim ad primos annos collectos 20. statim exerunt proximè sequentes.
Anni verò expansi dicuntur hi qui per 20. extensũ se continuè sine interruptione sequuntur.

Anni collecti

Anni expansi

tabellis conversionis horarum & minutarum &c. in minuta diei, &c. & contrariis, &c. facillime intelligetur. Sunt enim duae tabellae quas tituli earum ostendunt: quarum dispositio haec est. Tabellae istarum prima in duas tabellas particulares dividitur. Prima interius conversioni horarum tantum in minuta diei. Secunda conversioni minutarum, secundarum, tertiarum & quarumarum in minuta & secunda & tertia & quarta diei indifferenter: ut in suis patebit propositione immutata enim ibi de nominatio subscriptionis ut si prima linea sit minuta horae, in proxima linea è directo sunt minuta dierum: si secunda, proxima linea sunt secunda, & sic de aliis. Huius rei ratio est, quia sicut se habet minutum horae ad minutum diei, ita & hinc secundae horae ad secundam diei &c. Secunda tabula inservit conversioni minutarum, secundarum, tertiarum, & quarumarum &c. diei in horas & minuta & secunda, & tertia, & quarta &c. ratione qua supra. Necessitas primae tabellae fuit, ut cognitis horis equalibus & minutis &c. transitis post aliquam diem completam, quae per operationes instrumentorum vel per horologium sciantur, possent motus eis correspondentes per istas tabulas invenire, cum dies naturalis vel diurnus est, hic non in horas, sed in minuta dierum distinguitur. Secunda autem tabella conversionis minutarum diei &c. in horas & minuta &c. necessitas fuit, ut cognita aliqua conjunctione vel eclipsi & huiusmodi, & hoc per tabulas istas, in quibus operatur per minuta dierum, & non per horas, sicut dictum est in praecedentibus, sciremus horas & minuta horarum & c. minutis dierum & secundis &c. equalentis, ut tempus illud per instrumenta, quae per horas distincta sunt, possimus, si opus esset, observare &c. ¶ Distinctio autem motuum caelestium non dissimilis sit via qua in tempore. Gradus namque qui est pars sexagesima signi physici, quorum sex faciunt circulum vel revolutionem, vel trigesima pars signi communis, quorum duodecim faciunt circulum siue revolutionem, datur hoc in locum collectione motus integrum. Igitur cum collecti fuerint 60. gradus, ponatur pro eis unus signum physicum in istis tabulis frequentate licet in nonnullis tabulis hic insertis, si 30. gradus colligantur, pro eis ponatur unum signum commune, vel poterit operari. In fractione autem motus dividitur $\frac{1}{2}$. in 60. $\frac{1}{3}$. & minutum in 60. $\frac{1}{4}$. & secundum in 60. $\frac{1}{5}$. & tertium in 60. $\frac{1}{6}$. & ita si libuerit vitra modo illo quo fit in tempore. ¶ Ratio autem istius, cur Astronomi operationes suas ut plurimum sexagenario numero perficiunt, est ista. Tempus enim & motus caelestes sunt de numero continuorum. Continuum autem licet potest suscipere divisionem quantumcumque (est enim divisibile in semper divisibilibus) tamen quia nullus numerus sibi ipsi est ita aptus ad divisionem ut sexaginta (dividitur enim in duas partes, ut in sex 30. dividitur in quatuor partes, ut in quater 15. & in quinque partes, ut in quinq; 12. dividitur in sex partes, ut in sexies 10. & ita cõsequenter &c.) Merito ergo Astronomi calculantes in tabulis, suas operationes numero sexagenario frequentatis perficiunt. ¶ Ultimo hic non est ignorandum, quod Era est temporis, dignitas, honoris vel memoriae gratia, inchoati ab aliquo quo regum siue principum digno memoriae, ut in aliud considerationis siue propositum tempus eademmoda connumeratio.

quod era.

Tempus igitur quodlibet, hoc est, numerum annorum, mensium, atque dierum à principio alicuius ere nocte incipientis transitorum ad 4. 3. 2. & 1. tabulas ad hoc factas reducere, siue enim aliquid confluere. ¶ Intra etiam cum numero annorum collectorum in tabulas deferentes illi ere, scilicet quod poterit videre per titulos tabularum. Et si praecipi poterit numerus illorum dierum invenire, sumis est in directo 4. 3. 2. & 1. illis suis correspondens: si vero non invenire poterit, accipe numerum

HH in tem

16 propinquoſ, & 47 E & 7 que inuenies in directo, ſcribe extra ad parē eodē ordine quo ſunt. Deinde reſiduum annorū vel minorem propinquoſ quęque ut prius in eisdē tabellis & 47 E & 7 ibi inuenta ſcribe extra ſub aliis quodlibet ſub ſuo genere. ſ. 4. ſub quarta, 5. ſub quinta &c. & iterū intra eam reſiduo, ſi ſit reſiduū, intrando in tabulas tam annorū collectorum q̄ expanſorū quotiens oportuerit. Et ſimiliter cū menſibus cōpletis opore in tabella menſū ſuperiorū ſive priorū ſi annus fuerit eodē vel ad bifeſtilis, ſive inferiorū vel poſteriorum ſi fuerit bifeſtilis ſp̄ ſubſcribendo eſt ſub aliis quod inuenies in directo, quodlibet ſub ſuo genere, quoſq; totum numerū annorū & mīſum tolles. Si autē reſtant alij dies de menſe imperitico, quia ipſi ſunt prima, ſcribe eos ſub aliis primis. Quo ſacto aggrega omnia ad inuicem, incipiendo a primis. Et ſi ex aggregatione illarum ad inuicē exceſſerunt 60. adde vnitatē in ordine ſecundorū. Eodem mō ſi ex aggregatione ſecundorū ad inuicem exceſſerunt 60. adde ſimiliter pro illa vnitatem in ordine tertiorū. Et etiam ſi aggregatione tertiorū ad inuicem exceſſerunt 60. adde pro illa vnitatem in ordine quattorū reſidua verō ſint in locis propriis quo ſacto 47 E & 7 que in toto numero annorū, menſū & dierum propoſitorum continēbitur, tibi prouenient & era quam volebas eſt conſtituta.

¶ Et ut res hæc facilius capiantur, venimur exēpla ponatur q̄ cupimus reducere annos, mēſes & dies qui tranſierunt à tempore ere Chriſti note vſque ad annū propoſitum ſive currentē. 1492. die 20. Junii. Introbo igitur cū numero annorū propoſitori cōpleto. ſ. 1492. in tabulam propriā cōmune Annis Chriſti: ſed non inuenio in linea numeri annorum collectorū 1492. Annū, ſed bene inuenio 1000. & in directo eius inuenio 4. 1. 3. 4. 1. 5. 277. 30. que ſcribo extra ad parē, ſed in ordinem eorum quo ponitur. & remanent anni 492. quos iterum in eadē tabella annorum collectorū quero, & eos non inuenio præciſē, ſed bene inuenio 400. annos, & in directo eorū inuenio 40. 3. 40. 3. 3. 7. 10. que ſcribo extra ſub aliis quodlibet ſub ſuo genere, videlicet 4 ſub quartis &c. & remanēt anni. 92. quos iterū in eadem tabella inorū collectorum quero, & eos iterum non inuenio præciſē: ſed bene inuenio numerū propinquoſ minorē. ſ. 30. & in eorū directo inuenio 6. 0. 3. 8. 1. 7. 1. 0. quos iterū ſcribo extra ſub aliis quodlibet ſub ſuo genere &c. ut ſuprà, & reſtant anni, qui non inueniuntur in tabella eadem annorū collectorum, cū illa non habeat ita parum numerum. Incipiemus à 40. Intro igitur in ſecundam tabellā, que deſeruit annis expanſis Chriſti & inuenio intentū. Cūnos 11. & in directo eorum inuenio 5. 1. 5. 6. 1. 5. 7. que iterum ſub aliis extra ſcribo quodlibet ſub ſuo genere &c. Sed ſi fortē non inuenirem propoſitū ita præciſē: ut puta ſi reſiduū ſūctorum cum quo intratē in hanc tabellam annorū expanſorum, eſſent anni 26. intrarem primō cum annis minoribus propinquoſibus. ſ. 20. & quod in directo eorū inueniretur, ſcriberē iterū extra ſub aliis &c. Deinde cū reſiduū 6. Annis iterum intratē in eandem tabellam annorū expanſorum & quod in directo eorum inueniretur, ſcriberē ſimiliter extra ut ſuprà. Sed rediamus ad eram propoſitā noſtram vbi remanent ex prædictis annis expanſis menſes 5. quos que eſt annus bifeſtilis, quero in tabella inferiori menſium Chriſti, & eſt Manus cōpletus & in directo eius inuenio 1. 1. 7. 3. 1. que ſimiliter ſcribam ſub aliis &c. ut ſuprà. Et vltimō reſiduū ſunt dies 20. qui qua ſunt prima, eos ſcribo ſub primis, & deinde omnia iſta aggrego ad inuicem quodlibet ad ſuum genus ſecundūm modum ſuprà dictum &c. & numerus quattorū, tertiorū, ſecundorū & primorū, qui prouenit, eſt numerus quem volebamus. ſ. eram anni currentis 1492. die 20. Junii reducā: ita videlicet 4. 2. 7. 3. 1. 5. 19. 7. 19. Que oſa in opatione ſuppoſita cetera hędidiſimē poteris. Numerus annorū 1492. die 20. Junii currentiū. Numerus annorum perſectorum 1492.

& Christum & inuenio 7. 5. 7. 1 4. 7. 4 2. 7. 3 9. que addam ad illam quam habui, quia dilu-
uium præcessit Christum: & proveniunt 7. 7. 5. 4 6. 2. 1 7. 5 8. & est propositum.

Propositio tertia.

HRAE alicuius quartis, tertis, secundis & primis cognitis, numerum annorum,
mensium & dierum in eis contentorum inuenire: & est e conuersam primæ
propositionis. Si volueris hoc, intra cum numero quatuordecim &c. à principio
alicuius eræ pertransfatorum in tabulam propriam illi eræ, que tibi pertinet
hos patebit, vide licet quere cum numerum in quatuor ordinibus numerorum
sequentibus ordinem primam. s. annorum collectorum. Et si cum numerum poteris præcise
inuenire, annos quos inuenieris in directo scriptos in primo ordine numerorum, sunt anni
quos quæris correspondentes si autem ea præcise non inuenieris, tunc quare etiam in eadē
tabella numerum minorem propinquorem, & numerum annorum in directo inuentū ex-
trā scribe. Postea illa 4 5 7 & 7 quorum numerus erat minor q̄ numerus illorum cum qui-
bus debebas intrare, subtrahere ab illis, & cum residuo, vel cum minori propinquiori intra li-
terum tabellam eandem, vel annorum expansorum, in quibus poteris illum numerū vel mi-
norem propinquorem inuenire, & semper numerum annorum in directo inuentorum scribe
extrā sub alia p̄da scriptis. Deinde semper cum residuo totiens intra tam in tabellas an-
norum collectorum quam expansorum & etiam mensium, semper subtrahendo vt prius. Et
annos & menses quos in directo eorum inuenieris, sub alio annis scribe, quotiq̄ nihil sit re-
siduum de propositis quartis, tertis, secundis, & primis: vel solum si sit residuum & sit ita pa-
rum quod non possit complere mensem sequentem, tunc illud residuum eris dies mensis in-
completi sequentis menses quos per operationem inuenisti, vel eius dies primi mensis con-
dum

| Menses 5. Dies 20. | 7 | 5 | 3 | 2 | |
|--------------------------------|------|---|----|----|----|
| Annus collectorum | 1000 | 1 | 41 | 27 | 30 |
| Resid. collectorum | 400 | 0 | 40 | 30 | 0 |
| Resid. min ⁹ colle. | 80 | 0 | 8 | 7 | 0 |
| Annus expansi | 11 | | 1 | 6 | 57 |
| Menses | 5 | | | 1 | 32 |
| Dies | 20 | | | | 10 |
| Era | | 1 | 31 | 19 | 19 |

dum compleri, si nullam mensuram habuisti: & quod prouenit, est propositum. Sciendum quid tamen in ista propositione & in precedenti, quod si annus incompletus fuerit communis vel non bisextilis, oportet te intrare in tabellam mensium, vel superiorum, vel priorem: & si fuerit bisextilis, intra in tabellam mensium inferiorum vel posteriorum. Sic enim menses in tabulis suis duplici positione (ratione opificis cogente) insenti eas se offerent. ¶ Huius rei hoc uide exemplum. Sit era diluuii numerus reducendus in annos, & menses Christi &c. iste 4.7.7.46 i. i.7.58. Sed quis querendo istum numerum in tabula peopela, Christi in quatuor ordinibus numerorum post lineam numeri numeri annorum eam praecise non inuenio, accipio igitur numerum minor propinquorem ei, hunc uidelicet 4.6.3.45 i. 50.7.0. cuius annos in directo sibi correspondentes scribo extra, uidelicet 4000. Residuum ex subtractione minoris à maiori numerorum iam habitorum proueniens est iste, uidelicet 4.17.0.2.11.74.58. Sed querendo in tabula istum numerum eum iterum non inuenio praecise, accipio iterum numeri propinquioris, hunc uidelicet 4.0.7.50.7.43.7.45. Cuius lineas in directo sibi correspondentes iterum extra notabo, uidelicet 500: residuum quoniam iterum ex subtractione minoris &c. proueniens est hoc, uidelicet 3.9.2.28.7.13. Sed querendo iterum non inuenio eum ut 3. numerus minor propinquior est iste 3.8.7.7.0. cuius anni correspondentes sunt octo. Residuum iterum modo quo proueniens est 3.3.1.2.0.7.13. Quod querendo, quia non inuenio id in tabula annorum collectionum, sed in tabella annorum expansionum, non tamen praecise inuenio, idcirco accipio iterum numeri propinquioris minoris, hunc uidelicet 3.1.2.19.7.8. cuius annos correspondentes iterum noto extra, uidelicet 13. Residuum uelimo ex hac subtractione proueniens, quia querendo ipsam non inuenio in utraque tabella, inuenio id in tabella mensium inferiorum, quia annus est bisextilis, sed non praecise. Minor igitur & propinquior est iste, uidelicet 2.2.7.5. cui correspondunt menses 4. & ex subtractione istorum uelimo duorum restant 5. qui sunt dies. Qui anni ita extra scripti simul additi erunt illi qui à quartis, tertis &c. illius erae continebantur, numero 4.4.5.93. menses 4. dies 5. & hoc est propositum. ¶ Per istam propositionem & duas praecedentes erit, cuius unquam uolueris, poteris habere noticiam, dum tamen aliqua ex eris hypothesis sit tibi nota. Potes enim, uerbi gratia, cognoscere per primam propositionem 4.7.7. & 7. transacta à tempore Christi usque in tempus praesens. Per tertiam uero propositionem 4.7.7. & 7. à tempore diluuii usque ad tempus Christi. Et per praesentem propositionem poteris scire annos à tempore diluuii usque in praesens tempus: & est idem in omnibus aliis eris &c.

Tabula

Handwritten notes and corrections at the bottom of the page, including the name 'Alifsi regis' and some numerical adjustments.

EX tabula regionum, longitudinem & latitudinem locorum quorumcumque, hoc est, distantiam graduarum & elevationem poli inuenire. ¶ Sciendum quod dispositione dupli tabula regionum inuenitur, communi cum dispositione & frequentia, ea hoc modo ordinata inuenitur, vt loca primò eorū nominibus scripta cernatur, deinde in directo cuiuslibet loci sine oppidi scribitur primo ordine eius longitudo in gradibus & minutis ab occidente habitato, quod occidens habitarem distat ab occidente vero versus orientem per 17. Ȓ. & 30. m̄. Secundo autē ordine eius latitudo scribitur similiter in gradibus & minutis, que est sui poli super horizonem eleuatio: vnde distantia locorum longitudinalis non est nisi distantia gradualis, vel horaria sicuti meridianorum ab inuicē, & talis distantia solim sumitur ab oriente ad occidentem, & à conuerso. Sed distantia locorum in latitudine est differentia gradualis eleuationis poli supra horizonem in altero, & talis distantia est solim de polo ad polum sumpta: vnde latitudo alicuius loci non est aliud quàm eiusdem loci poli supra horizonem eleuatio. ¶ Scias tamen quia tabula p̄nti regionis per quam hic operamur, scribitur post nomina locorum (vt labor reductionis cuiuslibet abesse) differentie longitudinum in horis & minutis deinde per gradus, cū quibus si operari volueris ad diuersos mendanos à meridiano Tolei, operare vt dicam loco suo in propositionibus. ¶ In alijs enim tabulis regionum vbi longitudo gradibus & minutis confiat, necesse est si per eam operari volueris vt supra, vt longitudes duorum locorū ab inuicem subtrahas, minores s̄. a maiorē: remanens est differentia in gradibus & minutis. Quam deinde opus esset in horas & minuta &c. per sequentem conuertere, & deinceps cum isto operari, vt dicitur in suis propositionibus.

¶ Ex tabula item climatum & parallelorum vbi numerum polarem ex tabula regionum acceptum inuenies, illic in quo parallelō & climate illa crux sit, cognoscet, & diem eius longorem &c.

EX tabula vero propria quantitate dierum vbiuis diei cuiuscuque prolificatem agnoscas, si numeros in capite tabule positi eleuationem poli borealis significantes, & in lateribus extremis signa zodiaci cum ternis gradibus animaduertas. Nam illic ad quibuscūq; si accipias signum & gradum Solis, & à diretto ipsius sub numero eleuationis poli apparebit quantitas temporis semidurni in horis & minutis suis, si sol in aliquo signorum borealium fuerit, aut quantitas temporis seminoturni si in australi quopiam exierit. Quod tempus seminoturnum est 12. horis ibidem relinquit quantitate temporis semidurni. Et autē quantitate duplicata tunc tempus diurnū cōstabitur. Cum autem dies est nocte sua simul 24. horis contenti quantitate diei ex 24. horis demas, quantitas noctis relinquetur. q̄ si gradus Solis non apparet in alterutro extremorum ordinum, considerabis dies iuxta cum viciniores. Nam penes finem eius ad illos proportionaliter coniectabis quantitate temporis semidurni mediam quodammodo inter duas quantitates dierū duobus illis vicinioribus gradibus correspondentes. Porro semidurni temporis quantitas indicet quā hora Sol occidat, sicut & seminoturnum tempus ortum Solis declarat. Signa autem borealia sunt ♃ ♆ ♁ ♂ ♄ ♅ ♆. Australes verò ♁ ♃ ♆ ♅ ♄ ♃ ♁ ♂.

LL ii

Ex horis

EX horis æquinoctialibus siue æquibus, horas zodiaci siue inæquales extrahere. ¶ Numerum horarum ortus Solis (si horas inæquales diurnas volueris) ab horis post ortum lapsis subtrahis: & residuum seruas ad partem. Deinde semidurum per præcedentem acceptum, per sex partire: & numerus quotiens est quæritas horæ inæqualis, cum qua diuide residuum supra tam seruatam ad partem: & numerus præueniens est hora inæqualis diurna. Non dissimiliter horam inæqualem nocturnam inuenies, si horas occasus Solis ab horis post occasum subtrahis, & semidurum per sex partiris, & in cæteris ages in singulis per modum dictum de horis diurnis.

EX tabulis æquationis dierum, (quarum in præfati duplices sunt descriptæ, vetus I. & II. moderna III. & I. horarum æquationum dierum sub signis in capite, & in lateribus, in directo gradus Solis continentes) Diem diuersum, & æquationem dierum, & horam æquationis, & horam regionis inuenire. ¶ Hic est notandum, quod dies diuersus est integra firmamenti cum additamento illius partis, quam Sol interea, vero motu pertransiit reuolutio: Qui dies est dies apparent, ad quemque; dies elanduntur artificiales & dies autem mediocres siue æquales est completa firmamenti cum additamento arcus, quem Sol interea secundum motum medium pertransiit reuolutio: qui dies est Astronomicus, & ad hunc diem omnia motus tabule sunt constituta: vnde circa hæc discussio quædam nullatenus est negligenda. & est, quod circa horarum acceptiones contingit nos aliquando decipi, non recolentes de diuersitate dierum & horarum, ad quas æquatur cursus planetarum & horarum que per instrumenta accipiuntur, ad quas quidem ascendis & reliquodimus, nec non aspectus planetarum æquari præcipiuntur. Est enim inter eas diuersitas aliquâ de maior, aliquando inuise, & aliquando nulla: ut alibi habetur. Sed quemadmodum nos cauti esse debemus in luuando nos cum hæc diuersitate, his sequentibus intelligitur. Siquidem hora per instrumentum aliquod deprehensa, que hora regionis nominatur, ad quamque Ascendens, & relique domus æquantur, sic cognita, ad quam inuenire voluerimus vera loca planetarum. Hora igitur tali cognita, nos ex alterutra tabularum æquationis dierum, sub signo in directo gradus Solis circumscriptione æquas, æquationem dierum accipiemus, & illâ æquationem dierum, si eam ex tabula veteri accepimus, reducimus in tempus horarum per sequentem propositionem: (tabula enim moderna tempus reducendum continet) à tempore horæ cognite subtrahemus, & cum residuo loca planetarum inuestigabimus: & hæc horæ sic examinatz, vocatz sunt horæ æquationis. Si autem locus planete sit notus, sicuti locus constitutionis vel præætionis luminantis vel edianctionis aliquorū planetarū, vel eorū oppositio, aut introitus planete cuiuslibet, in quolibet gradu signi & nullibet & horæ qua hoc erat vel fuerat velimus inuenire: Tunc horis per aduentū stelle prodeuntibus ad locum addere debemus æquationem dierum secundum modum antè dictum, quemadmodum prius cū hora nota esset, & locum stelle inuenire velimus: æquationem dierum ab horis illis subtrahemus, & ita examinande sunt horæ, ut sciamus quæ sunt horæ æquationis, & quæ regionis.

Tabula

Tabula Climatuum, & Parallelorum, & augmenti longioris diei super
diem æquinoctii, & in diversis gradibus miliariorum.

0 **Æ**quator dierum, siue Æquinoctialis
1 habet diem horarum, 12. semper conti-
2 nuus. Et vnus gradus longitudinis conti-
3 net miliaria 60.

5 Primus parallelus differens ab æquino-
6 ctiali hor. 0. m. 15. habens diem maio-
7 rem hor. 12. m. 15.

9 Secundus parallelus differens ab æquino-
10 ctiali hor. 0. m. 30. diem habens maio-
11 rem hor. 12. m. 30.

13 **¶** Climatū primi principium, g. 12. m. 45.
14 Et est
15 Tertius parallelus differens ab æquino-
16 ctiali hor. 0. m. 45. habens diem maio-
17 rem hor. 12. m. 45. Gradus vnus conti-
18 net miliaria 59.

Climatū primi medium, g. 16. m. 40.
Et est

18 Quartus parallelus per Meroen, differens
19 ab æquinoctiali hor. 1. habens diem ma-
20 iorem hor. 13.

21 **¶** Climatū secundi principium, & finis pri-
22 mi est, g. 20. m. 30. Et est
23 Quintus parallelus, differens ab æquino-
24 ctiali hor. 1. m. 15. habens diem maio-
rem hor. 13. m. 15.

Climatū secundi medium est, g. 24.
m. 1. Et est
26 Sextus parallelus Tropicus Cancri
per Suenen, differens ab æquinoctia-
li hor. 1. m. 30. habens diem maio-
rem hor. 13. m. 30. Gradus continet
27 miliaria 57.

28 **¶** Climatū tertii principium, & finis se-
29 cundi est, g. 27. m. 10. Et est
Septimus parallelus, differens ab æqui-
noctiali hor. 1. m. 45. habens diem ma-
iorem hor. 13. m. 45.

Et est
Climatū tertii medium, g. 30. m. 42.
30 Octauus parallelus per Alexandriam
31 differens ab æquinoctiali hor. 2. ha-
32 bens diem maiorem hor. 14. Gradus
33 continet miliaria 54.

34 **¶** Climatū quarti principium, & finis ter-
35 tiū est, g. 33. m. 30. Et est
36 Nonus parallelus, differens ab æqui-
noctiali hor. 2. m. 15. habens diem
maio rem hor. 14. m. 15.

Climatū quarti medium est, g. 36.
m. 14. Et est
38 Decimus parallelus per Rhodum, dif-
ferens ab æquinoctiali hor. 2. m. 30.
habens diem maiorem hor. 14. m. 30.
39 Gradus continet miliaria 50.

40 **¶** Climatū quinti principium, & finis
41 quinti est, g. 40. m. 15. Et est
42 Undecimus parallelus, differens ab æqui-
noctiali hor. 3. m. 15. habens diem maio-
rem hor. 15. m. 15. Gradus continet
43 miliaria 47.

40 quatuor est. $\tilde{g} . 3 . p . m . 0$. Et est
Vndecimus parallelus, differens ab equi-
noctiali hor^o. 2. m. 45. habens diem maio-
riorem horarum. 14. m. 45.

Climatis quinti medium est $\tilde{g} . 41$.
m. 20.

42 Duodecimus parallelus per Hellespontum, differens ab equinoctiali hor^o. 3. m. 30. habens diem maiorem horarum 15. m. 0. Gradus continet miliaria. 47.

¶ Climatis sexti principium, & finis quinti est $\tilde{g} . 43$. m. 30. Et est
Tertiusdecimus parallelus per Bagan-
tum, differens ab equinoctiali horis 3. habens diem maiorem horarum. 15. m. 15.

Climatis sexti medium est $\tilde{g} . 45$. m. 14.

46 Quartusdecimus parallelus per Pontum, differens ab equinoctiali hor^o. 3. m. 30. habens diem maiorem horarum. 15. m. 30.

¶ Climatis septimi principium, & finis sexti est $\tilde{g} . 47$. m. 15. Et est
Quintusdecimus parallelus per Bori-
sthenen, differens ab equinoctiali hor^o. 4. habens diem maiorem hor^o. 16.

Climatis septimi medium est $\tilde{g} . 48$.
m. 40.

¶ Climatis octavi medium est $\tilde{g} . 50$.
m. 40.

48 Sextusdecimus parallelus, differens ab equinoctiali hor^o. 4. m. 30. habens diem maiorem horarum. 16. m. 30. Gradus continet miliaria. 43. cum dimidio.

¶ Climatis noni medium est $\tilde{g} . 54$.
m. 1.

49 Decimusseptimus parallelus, differens ab equinoctiali hor^o. 5. habens diem maiorem horarum. 17.

50 Decimusoctavus parallelus, differens ab equinoctiali hor^o. 5. m. 30. habens diem maiorem horarum. 17. cum dimidia.

51 Decimusnonus parallelus, differens ab equinoctiali hor^o. 6. habens diem maiorem horarum. 18. Gradus continet miliaria 32. & semis.

52 Vigintimus parallelus, differens ab equinoctiali hor^o. 7. & habens diem maiorem horarum. 19.

53 Vigintimusprimus parallelus per Thylen insulam, differens ab equinoctiali horis. 8. habens diem maiorem horarum. 20.
