per singula minuta extensa, universam sphaericorum triangulo-
rum scientiam complectens.

TYBINGAE APVD VIDVAM VLRI
d'Morhardi, Anno M. D. LIX,

T.YPOGRAPHVS ASTROPHILIS

S. D.

*Recitare Plato in Epinomis litteris prodidit: Gratia de Deo
sumam in astris, & doctrina astrorum sparsam esse. Et auctententiam
hoc ut mississimè reddidit disticho*

*Resi enim suspicientem in caelum, stellamq; contemplantem fatiri necesse est: esse
Dei aliquem sapientissimum & potentissimum; à quo haec pulcherrima mundi M. a
china orasit & constructur: amen, cum scientia beneficio caelum magis intrabit
erre discimus, & certissima nobis atq; aeterna motuum leges ac utices aperiantur
atq; monstrantur: fieri non potest, quin & assensio de Deo & providentia in ani
mis multo firmior evadat, & erga ipsum maior pietas excitetur inflammeturq;.
Cum igitur haec doctrina caelestium & lucidissimorum corporum Tabulae Clas
sissimi M. athenatici Iohannis de Regio monte plurimum lucis addant, usumq;
eius abundè pateant: gratum Deo invidere esse, ipsumq; laude quoq; affectum iri
existimari: Si cui t. h. d. i. n. o. s. t. r. a. o. p. e. r. a. cum praesertim à multis diu multumq; de
deratas esse situm studiosis Astrologiae iterum communicare non gravatè stude
rem. Nam ad hunc suscipiendum laborem non solum Typographi quidam aliis
exterae Academiae degentes: sed etiam nostrae huius Academiae studiosi &
conciues plures auctores mihi & monitores fuerunt. Quocirca cum & huius labo
rem Deo probari & laudi futurum, ac studiosos Astrorum non posse huius tabulae
carere, aut si archis parvos fructus capere intellexissent: sic passus sum, ubi per
suas dedit, ut eas tabulae de novo excudendas susciperem. A qui ut hac in melius meam
operam prestare possem, rogavi M. Samuellem I. stannengerum Prestanum: huic
enim demandata est harum artium initia tradendi & explicandae provincia in no
stra Academia: ut me in adendis tabulis nonnulli iuvaret. Eri inferiorum autem
se multo quàm ut in doctissimi M. athenatici tabulis magna fortia & diligentia
constructis aliquid vel emendare vel mutare posset, ingenius profitebatur: tamen
cum sepius ei meo precebus obstriperem, dedit consilium, paulo concinnius & pulch
erius orationis contextum disponendi; in qua quaedam emendata, quae à suis precep
toribus obstruata & indicata se habere affirmabat, libenter mecum communicavit.
Cum igitur optimi Astronomiae candidati, tabulae Regiomontani elegantiores*

3
Et correctiores multo, quam antea, opera nostra, quam libenter nobis nauauimus, in
lucem iterum prodicant; oro atq; obsecrauos, ut eam, quae uicinis sit, a quo animo in-
terpretemini. *Consulatio.*

Deum aeternum patrem Domini nostri Iesu Christi precor: ut in hac rerum
conium perturbatione aliqua Ecclesiae suae et sedolis hospicia, quibus cum alia mul-
ta tum etiam horrendi astrorum congressus et positus deinceps ruinam plurimasq;
caelestis de filio ipsius doctrina propagari laetè, haec de caelestium corporum maius et efficacia scientia con-
seruari et ad posteros transmitti possint. Bene et feliciter Valete, Tu-
bingae, Anno à Christo nato 1558. à condito mundo 1520. sub
occusum natusinum Humeri dexteri Orionis.

TOXITES LECTORI.

Quas iterum tabulas Isentmengerus adornat,
Mons peperit longè Regius ante tibi.
Non opus hoc aetas, preclaris inuida rebus,
Consumet; genio uiuet ubiq; suo.
Laudes ergo pijs meruere laboribus ambo,
Non alia hoc etenim praemia tempus habet.

IOANNES SECCERVITIVS.

Qui cupis in patriam celsos attollere uultus,
Sydera in ingenio nunc habitare tuo:
Huc ades, & sacri per Regia culmina montis,
Certa tuae uicolas haec monimenta uisæ.
Inuida, quæ solito ne crimine delet aetas,
Procedunt nidiis nunc renouata notis.
Scilicet extingui Regum miracula Memphis
Viderit, & moles Roma perire suas.
Haec tamen à saeuis, auro potiora, ruinis
Munera posteritas asseruisse uelis.

Quæ

Quæ qui paru. putat, Nundicq; in carcere cæco

Obliuata terrena lumina sece gerit:

Ille suas equidem stellas miretur in arca,

Et putet hic magni signa nitere poli.

Nos quæ prima uocat pietas, quæ nuntien in astris.

Curaq; cœlestes proxima monstrat opes.

Arte iuuuet superos iam nunc penetrare recessus,

Regnaq; moxæquo nostra futura Deo.

Omne felici quæ mens ut præmia tangat

Alig er his tabulis Dædalus esse potes.

S A. I S. B.

Tempus edax rabida quamuis metat omnia falce,

Mors quoq; sit saxis, marmoribusq; sua:

Non tamen hoc decus infringet ruinosa senecta

Ingenij, quod mons Regius ille dedit.

Nam uirtus nunquam, non mens bene docta latebit

Sed pia succedet, non peritura polo.

GEORGIUS OSTERMARIUS.

Cum sprætæ iaceant animis uulgaribus artes,

Cognita quæ certis legibus astra colunt:

Non tamen in tanto rerum discrimine uirtus

Incluta supremos est habitura rogos.

Si quid at in studijs uigiles meruere labores:

Hæc quoq; (crede mihi) pagina perpes erit,

Quæ tibi, quisquis ades, studio disposita fideli,

Ingenio magnas diuite promet opes.

Quare age sæpe legas hunc grata mente libellum,

Quem manet ingenio non periturus honor.

Vt tibi fertilibus ceu uinea culta racemis,

Vbere cum fructu commoda magna ferat.

REVERENDISSIMO IN CHRISTO
Patri & domino, domino Ioanni Archiepiscopo Strigonia
ensi, Legato &c, Ioannes Germanus de Regio
monte se humiliter com-
mendat.

Magnam esse admodum & fuisse semper in ædendis libris diffi-
cultatem mihi uideri solet; dum reuoluo maiorum nostrorum
exemplaria: ac præsertim eorum exordia conspicio, ubi peritæ
renuicatem ingeniorum suorum insinulant, non suffecturam ut
delicet cepto operi. Alij uero arduitate tentati negotij penè des-
serterit uidentur, nonnulli erratis suis uelam datum iri uolunt,
dubiam scribendi fortunam haud iniuria suspicantes. Mihi autem reuerendi-
sime Domine aliud præterea accedit, quod factum prorsus impossibile reuasi-
dæ scilicet iussioni tuæ morem gerere, ac demum iudicio tuo non minus acuto
quàm recto dignum aliquid reddere. Tuæ profecto monitioni nefas est contra-
uenire: qui enim licentius isme habeat imperium, præter te mortalis nemo est.
Vbi autem iacobrationes meas coram te iam rigido quàm perspicacissimo cen-
sore depromsero, labascet illico animus. Quis enim eruditissimus licet aliquid
nouarum literarum impune tibi afferret: quippe qui omni doctrina ac uirtute
mirum in modum præditus es; diuinarum humanarumq; rerum plenam tenes
cognitionem: omnibus cultu scancq; literaturæ cum te præbeas auditorem, omnes
tamen excellentissima etuditione tua antecellis adeo, ut discipulos sese fateantur,
quicumq; in habitu præceptorum ad te accesserint. Quantus es quàm profundus
in sacris existas literis: neminem ignorare arbitror, Quid referam de iure pontis-
ficio: cuius notitia quidem ornamento tibi est, usus autem dignitati tuæ perne-
cessarius, quippe qui supra omnes Prælatos regni Hungariæ primatum tenes:
uniuersa demum philosophia tibi familiaris est, disciplinæ autem quadruiuales
decus & gloriam pepererunt. Quod si ad negotia humana transeundi detur li-
cenda, quis non admirabitur immensam etiam prudentiam; ex qua totius regni
Hungariæ gubernatio penderet: ita tamen foris publicæ curas, ut domi quoq; mas-
gnificentiæ tuæ ineffabilis demonstretur: in arce inquam Strigoniensi, ad cuius res-
titutionem assiduam et si nullis parcas impensis, longè tamen ampliori sumptu-
solertiori: studio bibliothecæ præciosissimas, ac omni genere codicum referendis
simas instituisi. Quantam præterea & quàm perentrem curam habeas eondendi
studij generalis, conclamatum esse iam pridem arbitror, cum ex uniuersis litera-
rorum consortijs omnium professionum doctissimos quosq; uiros accersere so-
leas, officio fretus regij Cællarij supremi, cui cepto felicissimo me quorq; VVi-
cennensib

ennenſis collegij alumnorum quantumcumq; ad eſſe uoluiffi, docturum uidelicet
quadruuiales facultates. Venientij igitur, uoluntatiq; tuæ morem geſturo mihi
in primis id mandati dediſti, ut tabulas quaſdam directionum componerem,
quæ & uſu faciles & iudicibus utiles eſſent. Rectè quidem animaduertiſti diffi-
cultatem huiusce rei, quam profeſſo omnes Aſtologi tanquam horrendum ſco-
pulum declinant: nemo omnium eſt qui ſeſe tantis retribus ſatis expedire poſſit,
tameſi mukifaria huius negotij præcepta paſſim reperiantur. Hali nempe in
quarto libro ſuo artem directionum aſſerit eſſe complementum iudicij natalis:
quam ob rem operæ præcium decreuit, compilare tabulas ſoluedi nodos: quæ
cum noſtra tempeſtate nuſquam reperirètur, Parmenſis quidam Archidiaconus
auctorem ſecutus, tale contextit ad medium ſexti climatis, imbecilles tamen, ac
à mente Ptolemæi ejuſq; Commentatoris, imò & ab opinione propria quòd ſces
diſſimum eſt) longè alienas. Nam & ipſe modum dirigendi per ſphæram ſolidâ,
officio ſemicirculi Meridiano & Horizonti coeuntis ſummopere laudat, & Pro-
lemæum idem (quod uerum eſt) ſenſiſſe arbitrat. Poſtremo tamen in tabulis
ſuis ponit fiduciam, ſignorans utiq; quantum his duobus modis intereſſe poſſit
diſcriminis, quòd reuera 5. gradus (abſurdum diſtu) nonnunquam excedit. Erit
forſitan qui Ptolemæum clariffimum eiſdem quoſq; uirij inſimulabit, qui ppe
qui in tertio quadriparti ſui agens de ſpacio uices, paulo antequam ad duos di-
rigendi modos deſcendit, totius artis iacit fundamentum, neceſſarium quidem
ratus in directione ſequentis loci poſitionem ſimilem fieri poſitioni antecedentis,
id autem nequaquam accide, niſi locus ſequens traducatur ad ſemicirculum, in
quo ſtatebatur locus antecedens, quòd & Hali expoſitor eius confirmat. Ve-
rum duò modi eius cum exemplis à computatione directoria, qua memoratus
Parmenſis, ac penè omnes alij utuntur, non diſcrepant. Quid igitur de tam pru-
denti quàm eruditiffimo uiro ſentiemus? Nunquid tantum philoſophum repug-
nantes aſſeruiſſe ſententiâ ſi impunè ſuſpicabimur? Credo equidem Ptolemæum
& ſerio tradidiſſe fundamentum artis per ſemicirculos huiusmodi, & modum
numerandi apprimè calluiſſe, quamuis diſſicilem, adeò ut perplexum potius red-
deret auditorem quàm doctum. Satis ergo putans prope uerum uerſari, quàm
ueritatem ipſam radicus quaerendo deſperare, ſupputationes quaſdam breues
ueritati propinquas expoſuit. Quòd haudquaquam mirum uideri debet, cum et
noſtra ætate Ragulimus ſiſte Ioannes Gazulus tameſi Ptolemæi eruditiffimi,
Gehucq; acutiſſimi, ac aliorum plurimorum doctrinas acceperit, nullam tamen
prorſus numerandi facilitatem in directionibus ac æquandis domibus aduexit,
quinimo turbam maximam multitudinem argumentationum condauit. Quan-
tum itaq; difficultatis in hoc exiſtit negotio, ſatis liquet. Quid autem commodi
nancifeſcemur, ſi generalis quaedam artis directoriæ promptitudo nobis illata fue-
rit ex libris Iudicum abundè colligetur, ubi tempora futurorum accideſcium
omnium per directiones poſſimum inueſtigari ſolent. Tancam igitur utilitatem
præſul digniſſime directionum tabulæ aſſerent, quas pctebas in quacumq; regione
laticus

latitudinem 60. graduum non excedente, siue significator dirigendus in itinere
solari existat, siue ab eo uersus alteram polorum secedat, in quibus maximam
Solis ab Aequatore supposita declinationem trium & uiginti graduum cum die
medio, obseruationibus modernis maiorem non admittentibus. In omni demum
regione duodecim caeli domicilia constituere, ac in eis stellas distribuere, aliquid
plurimum sciri iucundissima per hasce tabulas addiscere licebit. Eas itaque primae
clas operum meorum suscipere digneris, quas ubi pro aetumine ingenij
tui probaueris, in publicum prodire iubeto.

Vale praesulum decus.

PRIMUM PROBLEMA.

Declinationem planetæ, habentis cognitum locum in Zodiaco, inuenire breuiter.

reperita fuerit.

Være signum & gradum loci planetæ in latere dextro tabulæ declinationum, si fuerit in medietate Zodiaci ascendente, uel in sinistro, si in medietate descendente extiterit: latitudinem autem si quam habet, in latere superiori transuerso, & in angulo communi offendes declinationem Planetæ quesitam, septentrionalem quidem, si supra scalam rubram, meridianam autem si infra eam

Quod si longitudo planetæ, uel latitudo eius, aut utraq; non fuerit expressa in lateribus tabulæ, agendum est duplici introitu, ut assolet, hoc pacto.

Intrabis primo cum longitudine & latitudine proximo minoribus, & angulum commune extra notabis, eum deniq; angulum commune conferas ad numerum immediate sequentem, inferiorem uidelicet, si longitudo planetæ in latere sinistro tabulæ accepta fuerit, aut superiorem si in latere dextro; & de differentia horum numerorum accipies partem proportionalem secundum proportionem minorum, iuxta gradus integros longitudinis existentium ad 60. minuta, addendam quidem angulo communi, si numerus sequens ipso angulo communi maior fuerit, minuendam autem si minor: quam partem proportionalem seruabis seorsum, cum nota additionis uel minutionis, uti res ipsa postulat.

Deinde pariformiter conferes angulum commune memoratum ad numerum ei collateralem, uersus sinistram quidem si latitudo septentrionalis fuerit, uersus dextram autem, si meridiana, et de differentia anguli communis numeriq; collateralis accipies partem proportionalem, secundum proportionem minorum latitudinis ad 60. addendam item ut prius, si numerus collateralis angulo communi maior fuerit, minuendam uero, si minor.

Has itaq; duas partes proportionales coniunges, si uel ambæ fuerint addendæ, uel ambæ minuendæ, cogentemq; earum angulo communi adijcies si addendæ fuerint, aut ab eo demes si minuendæ extiterint, collectus enim numerus aut restus declinationem quesitam manifestabit.

Si uero altera quidem memoratarum partium proportionalium addenda fuerit, altera autem minuenda, fuerintq; ipsæ æquales, angulus communis intractus pro declinatione planetæ habebitur.

Si autem inæquales extiterint, differentia earum addetur angulo communi, si maior pars proportionalis addenda erat, aut minuetur ex eo, si maior minuenda fuerat, & quod colligetur hoc pacto uel relinquetur declinationem planetæ computabit septentrionalem quidem, ut prius, si supra scalam rubram stiterit angulus communis, meridianam autem si infra.

Contingit autem nonnunquam scalam rubeam intersperere angulum commune & numerum immediate sequentem, tunc itaq; angulus communis iungendus est numero immediate sequenti, tunc itaq; angulus communis iungendus

De scala
ruba.

est numero immediatè sequenti, & cum aggregato agendum est pro parte proportionali elicienda, ut iam pridem cum differentia anguli communis numeris sequenti.

Verum si postremo non possit fieri subtractio ab angulo communi, fiat è contra, subtrahendo uidelicet àngulum communem ab ipsa parte proportionali, & relinquatur declinatione quaesita, alterius tamen denominationis, quàm erat angulus communis.

Et si planeta nullam habuerit latitudinem, intrabimus præfatam tabulã cum uero loco planetæ, & ex directo eius in columnula mediã, supra quam nullus scribitur numerus latitudinis, habebimus declinationem quaesitam.

Similiter agemus planeta latitudinem habente in minutis duntaxat, hoc tamen adiecto, quòd declinatio in angulo communi occurrens conferatur ad numerũ ei collateralẽ: sinistrum quidem, si latitudo septentrionalis fuerit, dextrum autem si meridiana: & de differentia numerorum accipiatur pars proportionalis, quemadmodum superius monitum est.

Quamuis autem de planetis solum hucusq; sermo sit habitus, potest tamen hæc tabula stellis etiam fixis accommodari, illis uidelicet, quæ latitudinem & graduum ab itinere solari haud quaquã egrediuntur.

In exemplo facilius forsitan accipies. Habeat planeta quispiam gradus 12. minuta 15. Virginis, cum latitudine septentrionali graduum 3. & minorum 24. Investigaturus igitur declinationem eius ab Aequatore, uideo gradus 12. Virginis, in latere sinistro tabulæ, 3. autem gradus latitudinis in fronte eiusdem tabulæ, sub quibus descendo usq; aduersum 12. graduum Virginis, ubi offendo numerum anguli communis graduum 9. minorum 5. cuius quidem anguli communis & numeri immediatè subsequenti differentia est 23. minuta, de quibus accipio partem proportionalem secundum proportionem minorum 15. longitudinis ad 60. quartam scilicet partem, quæ est ferè 6. minuta. Hæc autem pars proportionalis minuenda est, quòd numerus subsequens angulum communem minor eo fuerit.

Similiter confero angulum communem ad numerum ei collateralẽ uersus sinistram, cui latitudo planetæ septentrionalis subiecta est, & de differentia quæ est 55. minuta accipio partem proportionalem secundum proportionem 24. minorum latitudinis ad 60. illa pars proportionalis est 22. minuta, addenda uidelicet, quòd numerus collateralis angulo communi maior occurrit. Dempta itaq; parte proportionali longitudinis ex parte proportionali latitudinis, manent minuta 16. quæ adiungo angulo communi, & eadẽ inuenio declinationem planetæ septentrionalem 10. graduum et 7. minorum. Reliquas autem uarietates operationum cum & faciles sint, & ex iam nunc memoratis edisci possint, ingenio tuo relinquendas censuimus, ne diactati potius quàm utilitati studuisse uideamur.

SECUNDVM PROBLEMA.

Cumlibet stelle fixe uel planetæ declinationem generaliter computare.

Ex præcedenti didicimus, quo pacto cuiusvis stellæ latitudinem graduum non egredientis declinatione inuestigatur: cum aut plurimæ stellæ fixæ multo latius euagentur, quarum influxus cum propter corporum magnitudinem, tum propter earum ad alias siue fixas siue erraticas colligantiam uel commixtionem summopere animaduertendus est, siquidem stellæ fixæ (Ptolemaei testimonio) dant dona grandia, quamuis sæpenter infauste finiunt, decreuimus generalem declinationum computationem tradere, quo cautius atq; abundius genituræ iudicaturi, accidentia futura præuidere possint.

Stellarum fixarum effectus.

Intra bis igitur cabulam declinationis generalem cum longitudine stellæ, accipiendum uide licet gradum longitudinis in latere tabulæ sinistro, si nomen signi in fronte tabulæ reperitum fuerit, in latere autem dextro, si in calce tabulæ nomen signi offenderis, & numerum ex directo eius gradus occurrentem (qui inscribitur arcus) seorsum notabis eî denominatione sua, septentrionali uide licet, si signi longitudinis stellæ fuerit septentrionale, meridiana aut si meridiana: Est aut arcus huiusmodi portio circuli latitudinis per stellam incidentis inter Aequatorem & iter solare comprehensus: Notabis etiam numerum multiplicandum gradui stellæ obiectum.

Deinde latitudinem stellæ iunges arcui seruato, si eandem cum ipso arcui denominationem habuerit, eritq; aggregatum eiusdem denominationis cum ambobus, aut alterum ex altero deme, latitudinem scilicet ex arcu memorato, aut arcum ipsum ex latitudine, si diuersarum fuerint denominationum, residuum autem eam fortietur denominationem, quam habebat id à quo facta est subtractio.

Tale itaq; aggregatum uel residuum si quod fuerit, erit arcus circuli latitudinis stellæ, inter Aequatorem et uerum locum stellæ contentus. Nisi nullum esset huiusmodi residuum, quod accidit, dum latitudo stellæ & arcus circuli latitudinis inter Aequatorem & eclipticam æquales quidem, sed diuersarum existunt denominationum, nullam prorsus ab Aequatore declinationem stella ipsa pateretur.

Per sinum igitur rectum arcus iam nunc memorati multiplicabis numerum multiplicandum superius seruatum, & productum, quinq; primas figuras uersus dextram reijcies, unitate relictis adiuncta, si relictæ figuræ plus 50000. denotauerint. Hoc enim pacto sinum rectum declinationis stellæ cognosces, cuius arcum tabula sinus exemplo suscitabit, qui quidem arcus erit declinatio stellæ quæ sita, eadē tunc fortietur denominationem, quam habebat supra dictum aggregatum uel residuum.

Quando stella nullam habeat declinationem.

Quod autem paulo remissius præcepisse uideamur, si quando iuxta gradus los et stellæ minuta quæpiam iacuerint, prohibentia introitum tabulæ ad integros gradus factæ, hoc unum generaliter iubemus agendum esse duplici introitu ubi opus fuerit, quemadmodum in præcedenti monuimus, ac in alijs tabularum operibus fieri solet: quod qui non prius didicerit: quam hæc aggreditur tabulas, ineptus doctrinæ nostræ censetur auditor. Iam proposito nostro breue accedat modabitur exemplum. Stella quæuis in sine sit 12. graduum Virginis, habens latitudinem borealem trium graduum, Computaturo igitur mihi declinationem eius occurrat nomen signi in calce tabulæ, quã obrem accipio duodecim gradus in latere dextro,

Exemplum.

2 2 tabulæ

tabulæ, in quorum uersu supra nomen signi offendo arcum septentrionalem septem graduum & 39. minorum, numerumq; multiplicandum 92528. arcum iam dicto addo 3. gradus latitudinis stellæ, resultat arcus 10. graduum & 39. minorum, cuius sinum rectum, scilicet 11089. duco in 92528. producantur 1026042992. à quibus rejecto primas quinque figuras uersus dextram, & relinquntur 10260. sinus scilicet rectus declinationis quæsitæ, cuius arcum tabula sinus supponens semidiametrum circuli 60000. particularum red dit 9. graduum & 51. minorum.

TERTIVM PROBLEMA.

Cuiuscunq; planetæ ascensionem rectam facillime numerare.

INtra tabulam cæli mediationis cum uero loco planetæ ac latitudine eius si quam habet, & in angulo communi uidebis ascensionem rectam ab initio Arietis computandam.

Si tamen longitudinem planetæ, uel latitudinem eius, aut utraq; non inuenis, præcise in lateribus tabulæ ingrediere cum numeris proximo minoribus, & numerum anguli communis seorsum nota.

Deinde subtrahæ dictum numerum anguli communis à numero immediate ei subiecto, accommodatis 360. gradibus si opus fuerit, & de differentia eorum accipe partem proportionalem secundum proportionem minorum, quæ sunt iuxta gradus longitudinis ad 60. minuta.

Huiusmodi autem pars proportionalis semper est addenda in hoc negotio, scribe ergo eam seorsum cum nota additionis, similiter compara angulum communem ad numerum dextro lateri eius uel sinistro, uti processus latitudinis exigit, adiacentem, & minore eorum dempto ex maiore, de differentia accipio partem proportionalem secundum proportionem minorum, iuxta gradus latitudinis existentiam ad 60. minuta, quæ pars proportionalis addenda quidem erit quando numerus collateralis angulo communi maior existit, minuenda uero quando minor.

Si itaq; ambæ partes proportionales addendæ fuerint, collige eas, & congeris em angulo communi adicias.

Si autem ambæ minuendæ aggregatum earum ex angulo communi minuas.

Quod si altera quidem earum addenda fuerit, altera autem minuenda, differentiam earum adde angulo communi, si maior pars proportionalis fuerit addenda, aut minue si maior minuenda fuit. Quod enim hac lege uel colligetur uel residuum tribitur, ascensionem planetæ rectam numerabit.

In huiusmodi autem operatione nonnunquam colliguntur plures quam 360. gradus, tunc itaq; 360. abijcendi sunt, & residuum pro ascensione recta tenendum.

Stellæ autem latitudine penitus carentis ascensionem rectam inuenies uel incolumula media, cui figura 0. supra scribitur, uel per tabulam ascensionum restarum, quemadmodum communiter fieri solet.

Præterea

Præterea contemplandum est quod in principio tabulæ sub latitudine septentrionali, & in fine eiusdem sub latitudine meridiana contingit aliquando numerum anguli communis esse maiorem 356. gradibus, & numerum collateralem, dextrum inquam uel sinistrum, minorem 4. gradibus, aut è contra, tunc itaq; minori earum adiungendus est totus circulus 360. graduum, & aggregato utendum est, ac si fuisse repertum in tabula pro parte proportionali, ac cæteris operibus absoluedis.

Quicquid autem hætenus de planetis præcepimus de stellis quoq; fixis accipiendum est, latitudinem 8. graduum nequaquam exilientibus.

In exemplo reperatur stella qua usi sumus in primo problemate ex directo 12. graduum sub latitudine trium graduum septentrionali inuenio gradus 164. minuta 34. cuius numeri & proximo subsequenti differentia est 56. minuta, de qua differentia accipio partem proportionalem secundum proportionem 15. minorum ad 60. minuta, est autem pars illa proportionalis 14. minorum addenda, item dictus numerus anguli communis demptus ex numero collaterali sinistro relinquit 14. minuta, quorum pars proportionalis secundum proportionem 14. minorum ad 60. est fere 10. minuta addenda, congregatis itaq; huiusmodi partibus proportionalibus, & congerie earum adiecta ipsi angulo communi, resultabunt 164. gradus & 58. minuta: tantam igitur pronuntiabo ascensionem rectam stellæ propositiæ.

Q U A R T U M P R O B L E M A.

Ascensionem rectam cuiusuis stellæ generaliter inuestigare.

Intera tabulam cœli meditationum generalem, cum uero loco longitudinis stellæ & arcum Aequatoris ex directo eius repertum seorsum scribe cum numero multiplicando, arcum inquam qui inscribitur radix ascensionum. Est autem arcus huiusmodi portio Aequatoris inter principium Arietis & circulum latitudinis stellæ comprehensa.

Deinde cum declinatione stellæ ingredi tabellam secundam, & numerum ibidem repertum due in numerum multiplicandum iam pridem seruatum, a productoque primas quinque figuras uersus dextram abijce, nam residuus numerus solus, aut cum unitate si abiectionis figuræ plus 50000. significauerint, erit sinus rectus cuiusdam arcus Aequatoris intercepti à circulo latitudinis & circulo declinationis per uerum locum stellæ transeuntibus.

Quare itaq; arcum eius per tabulam sinus (eum arcum, qui à plerisque uocatur differentia transitus stellæ per cœli medium) quem adde radici ascensionum, si uerus locus stellæ fuerit in medietate eclipticæ descendenti, quæ uidelicet à capite Caneri incipit, & ad initium Capricorni per Libram incedendo desinit, & stella ipsa habuerit declinationem septentrionalem, aut si stella fuerit in medietate ascendenti eum declinatione meridiana.

Si fuerit in medietate descendenti cum declinatione meridiana, aut in medietate

te ascendenti cum septentrionali declinatione, minus prædictum arcum à radice ascensionum, quod enim hoc pacto eueniet, uel addendo uel minuendo, prout res ipsa postular, erit numerus ascensionis rectæ computandus in Aequatore ab initio Arietis.

Quòd si nõ potuerit fieri subtractio differentię, transitus per cœli medium ab ipsa radice ascensionum adiungendus est integer circulus 360. graduum memorate radici, ut ab aggregato possit fieri subtractio.

Si præterea stella nullam habuerit declinationem, radicem ascensionum pro ascensione recta stellæ tenebis.

Hoc demum non est silentio prætereundum, quòd cum quilibet sinus rectus minor sinu quadrantis duos habeat arcus, unum scilicet minorem quadrante, alterum autem maiorem eo, tunc quidem accipiendus est arcus minor quadrante, quando arcus circuli latitudinis per stellam transeuntis, qui inter Aequatorem & uerum locum stellæ comprehenditur, minor quadrante circulum existit, tunc autem maior, dum ille quadrantem superabit.

Exempli.

Verbi gratia repeto stellam, cui in secundo problemate tribus 12. gradus Virginis cum tribus gradibus septentrionalis latitudinis. In crani itaq; mihi tabulam cœli meditationum generalem cum 12. gradibus Virginis, obijciunt radice ascensionis habens 160. gradus et 29. minuta, numerusq; multiplicandus 14590. huic stellæ in secundo problemate computata est declinatio septentrionalis 9. graduum & 51. minorum, quibus medianibus per tabellam secundam duplici introitu inuenio multiplicatorem 17363. cum duco in 14590. procreantur 426956170. à quibus rejeto primas 5. figuras, uice earum tamen addendo unitatem relicto numero quinquidem excedunt 50000. sic habeo 4270. sinum rectum differentię transitus per cœli medium, cuius arcus est 4. gradus & 5. minuta, quem adiungo radici ascensionum, & resultat ascensio recta quæ sita 164. graduum & 34. minorum.

Q V I N T U M P R O B L E M A.

Ex ascensione recta cognita arcum eclipticæ sibi ascendentem indagare.

Quare numerum ascensionis rectæ in corpore tabulæ ascensionum reætarum, & ex directo eius in fronte quidem signi Zodiaci, in latere autem dextero uel sinistro numerum graduum eiusdem signi habebis.

Si autem ascensionem rectam propositam non inuenis precise in area tabulæ memorate, accipe duas ascensiones rectas in tabula expressas, quarum altera quidem proximo minor extat ascensione proposita, altera autem immediare maior, & minor earum ex maiore dempta, numerum reliquum appellabis primum, qui quidem est portio uni gradui eclipticæ debita.

Deinde prædictam ascensionem minorem subtrahere ab ascensione recta proposita, & residuum pro numero secundo teneto. Tertius autem numerus semper erit 60. minuta. Duc itaq; secundum in tertium, & productum diuide per primum, quod

quod namq; huiuscemodi diuisione partum fuerit, de minutis adscendum erit, numero graduum eclipticæ ex directio ascensionis rectæ minoris inuenio, & colligitur numerus graduum ac minorum quos habet arcus eclipticæ quaesitus.

Sic uerbi gratia ascensio recta data 57. gradus & 54. minuta, quam non inuenio præcisè in area tabulæ ascensionum rectarum: sed proximo ea minor est 57. gradus & 38. minuta, proximo autem maior 98. gradus & 43. minuta, hæc autem ascensionum differentia est unus gradus & 5. minuta, id est 65. minuta. Per resolutionem ecce primus numerus, minor deniq; dictarum ascensionum subtrahita ex ascensione recta proposita relinquit 16. minuta, secundum scilicet numerum, cæterus autem numerus erit 60. minuta, duo igitur secundum in tertium, producantur 960. secunda, quæ diuisa per primum numerum scilicet 65. minuta, elidantur 15. ferè minuta addenda 7. gradibus Cancrî.

Exemplum

SEXTVM PROBLEMA.

Punctum eclipticæ cum quo stella quæuis cælum mediat perferuari.

Huiusmodi punctum eclipticæ non potest facilius ac breuiter inueniri quàm per ascensionem rectam ipsius stellæ, quò certè præmittendum erat, quæ lege talem ascensionem rectam computare liceret. Nam ipsa ascensio recta sæpenumero utilis est & pertaxime in directione significatoris cuiuscunq; tametsi punctum, cum quo significator talis cælum mediat, ignoretur. Vnde scorsum docere libuit computationem ascensionum rectarum, ne quis directurus significatorem quæmpiam arbitretur opus esse inuentione puncti, eum quo significator huiusmodi cælum mediat.

Ad rem igitur redeuntes posteaquàm ex altero duorum antecedentium docuimur, tertio scilicet uel quarto, didicimus ascensionem rectam stellæ propositæ, quaeremus eam in tabula ascensionum rectarum ab Ariete incipientium, & ex directo eius in capite quidem tabulæ signum, in latere autem gradum eiusdem signi, cum quo stella talis mediat cælum duplici etiam introitu si opus fuerit offendemus. Talis enim ascensio recta communis est stellæ propositæ, & gradui uel puncto eclipticæ, cum quo ipsa mediat cælum.

Huius autem problematis exemplum si desideras, ad præcedens refugies dum est problema.

SEPTIMVM PROBLEMA.

Arcus eclipticæ quantocunq; in omni regione, cuius latitudo 60 gradus non excedit, ascensionem obliquam per computum certum deputare.

Cognita latitudine regionis ad quam operari instituis, aut eleuatione poli supra Horizontem quemcunq; uoles, intra tabulam ascensionum obliquarum ei subiectam eum signo & gradu finali arcus propositi, & in angulo communi habebis ascensionem obliquam respondentem arcui eclipticæ proposito, computandam quidem à sectione uernali, si arcus eclipticæ datus ab eadem sectione sumperit initium,

Si uero aliunde arcum quempiam eclipticæ inchoaueris, quare primo ascensionem obliquam principio eius debitam, secundum modum iam nunc traditum, deinceps pariformiter ascensionem obliquam fini eius adinuenientem addisceas. Subtrahita enim ascensione obliqua principio ab ascensione obliqua finis eius, accommodato integro circulo si opus fuerit, relinquetur ascensio obliqua arcus propofiti.

Memento tamen agendum esse duplici introitu, ut affolet, si quæ ultra gradus integros minuta fuerint in arcu eclipticæ propofito.

Si denique eleuatio poli minuta quedam habuerit, operare primo per eleuationem poli, proximo minorem secundum modum iam expofitum.

Deinde per latitudinem proximo maiorem, & inuenta duplici ascensione obliqua ad eundem arcum eclipticæ minorem deinde ex maiore, relicta namque differentia respondebit uni gradui eleuationis poli, de qua accipe partem proportionalem secundum proportionem minorum ultra gradus integros eleuationis poli existentium ad 60.

Hanc itaque partem proportionalem adde ascensioni obliquæ primæ, si ipsa minor exiterit ascensione obliqua fecunda, aut ab ea minue si ipsa prima superauerit secundam. Nam quod alter horum modorum eueniet, ascensionem obliquam numerabit quam quærebas. In exemplo facilius accipies.

Habeat arcus quidam eclipticæ 12. gradus & 15. minuta Virginis, uolo inuenire ascensionem eius obliquam in regione, cuius poli eleuatur 47. gradibus & 45. minutis.

Intro cum 12. gradibus Virginis tabulam 47. graduum, & inuenio 155. gradus & 46. minuta, quos demo ex 157. gradibus & 7. minutis, quæ respondent 13. gradibus Virginis in eadem tabula 47. graduum: de differentia autem relicta, quæ est unus gradus & 11. minuta, accipio partem proportionalem secundum proportionem 15. minorum ad 60. hæc pars proportionalis est 10. minuta ferè addenda primæ ascensioni obliquæ.

Item eandem ascensionem primam confero ad 155. gradus & 29. minuta, quos reperio iuxta 12. gradus Virginis in tabula 48. graduum, & de differentia quæ est 17. accipio partem proportionalem secundum proportionem 45. minorum eleuationis poli ad 60. minuta, pars illa proportionalis est 13. minuta ferè subtrahenda ab ascensione obliqua prima.

Habeo itaque duas partes proportionales, quarum altera quidem est addenda primæ ascensioni obliquæ, altera autem minuenda ex ea: quam ob rem demo minorem earum ex maiore, & relinquuntur 7. minuta, quæ adfecta sæpe memorata ascensioni primæ constant ascensionem obliquam quæ sitam 155. graduum & 53. minorum.

OCTAVVM PROBLEMA.

Defensionem obliquam cuiuscumque arcus eclipticæ dimetiri.

S I arcus eclipticæ propositus ab Ariete sumpserit initium, addè ei semicircu- lum, & aggregari arcus eclipticæ ascensionem obliquam ex præcedenti ad- discas, dempto enim semicirculo ex iam memorata ascensione obliqua re- linquetur descensio obliqua arcus propositi à sectione. vernali computanda.

Sed arcu eclipticæ propositio aliunde sumente initium, quære ex præcedenti ascensionem obliquam arcus ei diametraliter oppositi. Nam tanta quoq; erit des- censio obliqua arcus propositi. Arcus autem diametraliter oppositos appello eos, quorum principia inuicem & fines diametraliter opponuntur.

Descensio uero recta arcus quancumq; in Horizonte uidelicet recto æqualis est, imò eadem ascensioni rectæ eiusdem arcus, quamobrem non erat opus seorsum tradere, quo pacto talis ascensio recta computaretur.

Exempli gratia uolo numerare descensionem obliquam ad finem 12. gradus Virginis in regione habente latitudinem 48. graduum: addo arcui eclipticæ pro- posito semicirculum, & perducor ad 12. gradus Piscium, quorum ascensio obli- qua est 351. gradus & 21. minuta, ex qua ascensione demo semicirculum scilicet 180. gradus, & relictos 171. gradus cum 21. minutis pronuntiabo descensionem obliquam arcus propositi.

Exempli.

Sed si libeat inuenire descensionem totius signi Virginis, accipio arcum ei dia- metraliter oppositum, scilicet totum signum Piscium, cuius principium qui- dem habet ascensionem obliquam 345. graduum & 10. minorum, finis au- tem est 360. demptis igitur illis ex istis relinquentur mihi 14. gradus & 50. mi- nuta, & tanta erit descensio obliqua signi Virginis.

NONVM PROBLEMA.

Quantum arcus eclipticæ debeatür cuiusq; ascensioni uel descensioni oblique perferuari.

M Iste numerum ascensionis obliquæ in tabulam ascensionum obliquarum, eam uidelicet, cui latitudo regionis uel eleuatio poli data supra scribatur, & ex directo ipsius in summitate quidem tabulæ offendet signum Zodi- aci, in latere autem numerum graduum eiusdem signi qui debentur ascensionis obliquæ propositæ, quemadmodum in quinto problemate circa ascensiones res- ctas monuimus.

Si tamen eleuationem poli septentrionalis nusquam inueneris precise, quod accidit minutis quotlibet iuxta gradus existentibus, operare primo per tabu- lam latitudinis proximo minoris secundum uiam iam nunc monstratam.

Deinde similiter per tabulam latitudinis proximo maioris, & de differentia arcuum eclipticæ inde elicitorum sume partem proportionalem secundum pro- portionem minorum quæ adjacent gradibus integris propositæ eleuationis poli, ad quam partem proportionalem addè arcui eclipticæ per tabulam minoris eleuationis computato, si ipse minor fuerit arcu eclipticæ per tabulam maio-

ris.

ris elevationis reperto, aut ab eo minux si maior eo fuerit: & quod uel addendo obligetur, uel minuendo relinquatur, prout res ipsa postulat, numerabit arcum eclipticæ quæsitum.

Sed quartus arcus respondeat descensioni propositæ, sic scilicet, ipsi descensionis datæ semicirculum id est 180. gradus adde, & aggregato tanquam ascensionis oblique arcum eclipticæ computa secundum modum iam nunc traditum, h quo arcu eclipticæ semicirculum, uidelicet 180. gradus aut sex signa communia, minue, quod enim relinquatur erit arcus eclipticæ quem perbas.

Hæc autem documenta tenent, ascensione uel descensione obliqua à sectione uernali incipitum sumente.

Nam si aliunde inciperet, inuenienda essent modo prædicto duo puncta eclipticæ, quorum alterum quidem principio, alterum autem fini talis ascensionis uel descensionis oblique responderet. Arcus enim eclipticæ duobus talibus punctis interceptus esset qui quærebatur. Is quidem modus erit exacte computatætionis.

Nam si celestis ac proprie ueram agere decreueris, licebit uis tabula ascensionum obliquarum, cuius inscriptio aut titulus uicinijs erit latitudini regionis, uel elevationi poli ad quem uolebas operari.

Nunc quo facilius ante dicta intelligantur, exemplaris computatio subicienda est: uerum quando iuxta gradus elevationis poli non sunt minuta à iqua, operatio omnino similis erit ei quam in quinto problemate exposuimus.

Exempla.

Sic itaq; euasio poli 47. graduum & 45. minorum, ascensio autem obliqua proposita 70 graduum & 36. minorum proceddo secundum modum quinti problematis inuenio 7. gradus & 16. ferè minuta Cancrî ad elevationem impositi 47. graduum: similiter ad elevationem poli 48. graduum reperio 8. gradus & 11. minuta Cancrî.

Horum duorum arcuum eclipticæ differentia est 55. minuta, de quibus pars proportionalis secundum proportionem 45. minorum ad 60. est 41. minuta ferè quæ adiecta arcui eclipticæ ad 47. gradus reperto, constant 8. gradus & 7. minuta Cancrî, arcum scilicet eclipticæ quæsitum pro ascensione demum obliqua.

Breue exemplum accipe: offertur mihi descensio obliqua 57. graduum & 34. minorum, cui correspondentem arcum eclipticæ iubeor inuestigare ad elevationem poli 48. graduum. Adiuugo memoratæ descensionis 180. gradus, & residuae 127. gradus & 34. minuta, hunc arcum tanquam ascensionem obliquam esse fendo in tabula 48. graduum iuxta 11. gradus Sagittarij, relictisq; 6. signis communibus perducor ad 12. gradus Geminorum, qui uidelicet respondent obliatæ descensionis.

DECIMUM PROBLEMA.

Ascensionem obliquam stelle cuiuscunq; in Horizonte qualibet dinumerare.

Vsui tabule differentiarum

Hic nostro proposito seruiet tabula differentiarum ascensionalium, dum stellæ non pluribus quam 32. gradibus ab Aequatore remouetur.

In latere enim sinistro dictæ tabulæ utriusque partis est borealis quàm australis *narum de*
declinatio usque ad 12. gradus ponitur, quod nullus planetarum, quorum gratia *scensionum*
possimum tabulam ipsam condidimus, tantam declinationem egredi solet. *lin.*

In latere autem superiori transuerso ponuntur eleuationes poli septentriona-
lis, supra Horizontes regionum ac circulos positionum usque ad 60. gradus.

Arca autem tabulæ differentias ascensionum complectitur.

Eleuationem igitur poli quære in fronte tabulæ memoratæ, declinationem
autem stellæ siue borealem siue australem in latere sinistro. Nam quod in angulo
communi offendes, erit differentia ascensionum stellæ propositæ, quam demas
ex ascensione recta, stellæ superius inuenta, si declinatio stellæ borealis fuerit, aut
eisdem adijctas si australis extiterit. Sic enim uel relinquetur uel colligetur ascen-
sio obliqua stellæ quam quærebas ad Horizontem propositum.

Quod si stellæ fixæ ampliore quàm 32. graduum declinationem habentis
ascensionem obliquam computare libeat, intra bis tabellam secundam cum ele-
uatione poli supra Horizontem datum, & numerum ex directo eius occurrem
tem seruabis.

Similiter in eadem tabella accipies numerum cum declinatione stellæ ad quam-
cunque partem fuerit, horum numerorum alter alterum multiplicet, et productum
per 5. extendatur, reiectisque primis sex figuris uersus dextram, unitatem relictis
iungendo, si reiectæ plus 50000. denotauerint, relinquetur sinus rectus differ-
rentiæ ascensionum stellæ propositæ, cuius sinus arcum docet hic tabula sinum
maximum habens 60000. particulaum.

Cognita itaque differentia ascensionum ueteris ad ascensionem obliquam stellæ
sciendam, quemadmodum iam pridem monuimus. Facilius tamen idem efficies,
si tabula tua maximum sinum habeat 10000. Nam altero duorum numerorum
per eleuationem poli ac declinationem stellæ inuentorum in alterum multiplica-
to, a producto abijcies quinque figuras primas uersus dextram, unitate relictis ad-
iuncta, si abiectæ plus 50000. representauerint, & reliqui sinus recti arcum ex
tabula memorata elices, qui erit differentia ascensionum proposito tuo condu-
cibilis.

Hic tamen animaduertendum, quod quando differentia ascensionum ab ipsa
ascensione recta subtrahi nequit, adijciendus est integer circulus 360. graduum,
& ab aggregato minuenda est differentia ascensionum præfata.

Similiter quando differentia ascensionum adiecta ascensioni rectæ numerum
maiores 160. gradibus coacerauerit, ipsi 360. gradus reijciendi sunt, reiectis
uidelicet pro ascensione obliqua computatis.

In exemplo repesatur stella secundæ problematis, quæ habuit declinatio- *Exempli.*
nem septentrionalem 9. graduum & 11. minutorum: uolo inuenire ascensio-
nem eius obliquam in Horizonte, cui polus eleuatur 48. gradibus, per tabu-
lam igitur differentiarum ascensionum sub eleuatione poli 48. graduum cum
declinatione

declinatione 9. graduum & 51. minorum duplici introitu inuenio differentiam ascensionum 11. graduum & 7. minorum, quam demo ex ascensione rectæ stellæ inuenta per tertium aut quartum problema, quæ 164. gradus, & 14. minuta, sicenim relinquatur obliqua 153. graduum & 17. minorum.

Secundam uiam autem uniuersalem sic procedo.

In tabella secunda iuxta numerum eleuationis poli 48. graduum inuenio numerum 111062. quem seruo ad partem.

Item per eandem tabellam cum declinatione stellæ duplici introitu elicio alium numerum 16364. quem duco in prius seruatam numerum, producantur 1728480368. ille numerus per senariū multiplicatus reddit hunc 11570883408 abiectis autem primis sex figuris, adiecta que unitate, ut aſolet, remanet mihi sinus differentie ascensionum 11571. cuius arcus est 11. gradus & 7. minuta, cum quo tandem, ut prius, ascensio obliqua reperitur. Tabellam autem sæpe dictam non iniuria fecundam appellare libuit, quod multifariam ac mirandam utilitatem inſtar fecundæ arboris parere soleat.

V N D E C I M V M P R O B L E M A.

Descensionem obliquam stellæ cuiuscunque numerare.

Inuenta differentia ascensionum stellæ propositæ ex præcedenti documento, adde eam ascensioni rectæ ipsius stellæ declinationem septentrionalem habentis, uel minue huiusmodi differentiam ascensionum ab ea, si declinatio stellæ fuerit meridiana. Nam quod colligetur aut residuabitur, erit descensio obliqua stellæ propositæ.

Hic non est opus exemplo aliquo speciali, cum differentia ascensionum, quæ prius addita est, pro ascensione obliqua habenda, hic subtrahitur pro descensione obliqua, & e contra quæ ibi subtrahitur, hic additur.

D V O D E C I M V M P R O B L E M A.

Arcum semidiurnum Solis uel alterius stellæ cuiuscunque cognoscere.

Inuenias modo prædicto 10. problematis differentiam ascensionum stellæ, quæ est etiam dimidia differentia diei æquinoctialis & diei inæqualis stellæ, eam igitur 90. gradibus adiunge, si stella declinationem septentrionalem habuerit, aut eam ex 90. gradibus minue pro stella declinationem habente meridiana.

Sicenim uel constabis uel residuabis arcum semidiurnum stellæ propositæ, quo demum ex 180. gradibus dempto, relinquetur arcus semiocturnus. Et item arcu semidiurno duplato arcus diurnus, & semiocturno geminato nocturnus prodibit aratus.

Quorum utrumuis si per quindenos quidem gradus partiaris numerus horarum æqualium ei respondentium profiliet, per duodenas autem particulas si secueris, quantitas horæ inæqualis uel temporalis emerget.

Idem quoque effices per differentiam ascensionum, aut dimidiam diurnam differentiam, Nam si eam per 15. diuiseris, & numerum quotiens senario addideris

Differentia ascensionis quid sit.

addideris pro septentrionali declinatione. aut ex ea dempseris pro meridiana, habebis numerum horarum æqualium temporis semidiurni, cuius duplum horas totius diei numerabit.

Si deniq; eandem differentiam ascensionum per senarium distribueris, & numero nascenti 15. adieceris pro septentrionali declinatione, aut ex 15. dempseris pro meridiana, resultabit quantitas horæ inæqualis.

Verum arcus diurnus Solis alia lege computari poterit, subtractis enim ascensionibus obliquis loco Solis uero respondentibus ab ascensionibus obliquis puncto ei diametraliter opposito pertinentibus, relinquetur arcus diurnus solaris. Idem quoq; modus obseruabitur de quocumq; puncto e ellipticæ, tametsi Sol in eo non fuerit.

Quod si habueris tabulam ascensionum rectarum apud Capricornum incipientem, subtrahæ ascensionem obliquam, cuius puncto ellipticæ debitam ab ascensione eius recta, & relinquetur arcus semidiurnus eiusdem puncti.

Repeto exempli causa stellam cuius differentia ascensionalis est 11. gradus et 7 minuta, quemadmodum in decimo problemate ostensum est. quæ uocari solet etiam dimidia differentia diei æquinoctialis, & diei inæqualis: quare cum arcus semidiurnus æquinoctialis sit 90. graduum, & declinatio stellæ sit septentrionalis, addo eam 90. gradibus, & resultant 101. gradus cum 7. minutis. Tantusq; habetur arcus semidiurnus stellæ propositæ.

Quæ deinceps minuo ex 180. gradibus, & remanet arcus seminocturnus 78. graduum ac 53. minorum. Item duplabo arcum semidiurnum eueniant 101. gradus & 14. minuta pro arcu diurno.

Similiter duplabo arcum seminocturnum resultant 157. gradus cum 46. minutis, arcus scilicet nocturnus.

Deinde arcum diurnum diuido per 15. & exeunt 13. horæ æquales cum 19. minutis horæ, accipiendo uidelicet triæ unuscuiusq; gradus relidit post diuisiõem 4. minuta, & pro singulis 15. minutis gradus unum minutum horæ.

Præterea diuido arcum diurnum per 12. & exeunt 16. gradus cum 51. minutis. Residuum enim facta diuisione per 60. multiplicauit, & producto addidi minuta 14. collectumq; totum iterum per 12. diuisi, ascendunt igitur 16. gradus & 51. minuta in una hora temporali uel inæquali. Cætera omnia sunt facilissimæ computationis.

T R E D E C I M V M P R O B L E M A.

Punctum ellipticæ, cum quo stella quæritur uel oritur uel occidit, inquirere.

Inuenta ascensione obliqua stellæ propositæ per 10. problema, quære arcum ellipticæ ei respondentem per 9. Punctus enim terminalis eiusdem arcus ellipticæ oriri solet cum stella proposita.

Non aliter elicies punctum cum quo occidit, si prius didiceris quantus arcus ellipticæ descensionis eius obliquæ tribuatur.

Est & alius modus inueniendi punctum cum quo stella occidit.

Alio modo
dicitur inveni
endi punctum
cum quo stella
occidit.
Obiectio.
Solutio.
Directio.

Sic enim ascensioni obliquæ ipsius stelle arcum diurnum eius adieceris, prodi
bit ascensio obliqua puncti orientis dum stella occidit. Eo igitur puncto per 9,
problema cognito, punctus quoque diametraliter ei oppositus haud quaquam la
tebit, cum quo videbitur stellam propositam oportet occidere.

Exemplo autem nullo opus est in præsentiarum: si novum & decimum & un
decimum problema satis didicisti.

Sed mirabitur forte quispiam, quod tam diu computandis ascensionibus &
descensionibus immoratus sim, quandoquidem directiones præcipuè tractare
institerim: nemini profecto iniquum uideri debet illud, si quidem absq; noticia
ascensionum ac descensionum directiones absolui nequeunt, imo directio non est
aliud nisi arcus quidam Aequatoris coascendens uel condescendens, cuiuspiam ar
cui eclipsicæ, aut alij intervallo duorum locorum cognitorum, uel uti inferius ex
planabitur. Quicumq; igitur in dirigendis significatoribus expediri esse uolet,
in computu ascensionum ac descensionum prius apprime exerceatur necesse est.
Nunc ad negotium æquandarum domorum defendere libet, ea namq; res do
ctrinam directionum antecedere debet, cum significatores nonnunquam ad cus
pides domorum, aut ipse cuspides ad alia loca dirigi solent.

Vsue Ascē
sionem.

DECIMUM QVARTVM PROBLEMA.

Initia duodecim domorum cœli rationabiliter constituere.

Priusquam ad propositum absolueudum uenietur paulo altius ordiendum
est, ne præcepta nostra inania ac fundamento carentia quispiam suspicetur.

Tres æquandarum domorum accepimus modos, quorum primus & us
sitatissimus arcum semidiurnum puncti eclipticæ orientalis, aut arcum Aequa
toris e similem in tres æquas secat portiones, & arcum seminocturnum, eius in
totidem, per puncta q; diuidens et punctum eclipticæ orientale, ac polum mun
di utrumq; singit quinq; circulos magnos, qui cum Meridiano totum Zodiacum
& ipsum cœlum in 12. partes diuidunt, quas uocant domos.

Hæc domorum distinctio quam fluxa & fragilis sit (pace uulgarium Afros
domorum dixerim) ex problematibus, quæ super almagesto Ptolemæi conscri
psimus, aperte quibus intelliget. Nam ut ex multis pauca decerpantur, spacia do
morum hac lege distinctarum magnitudines certas ac firmas seruare nequeunt,
quas profecto seruandas esse confiteberis, si circa influxus aut proprietates hui
usmodi domorum rectè philosophari libeat. Oriæ quippe Canero in regione,
diem longissimum 10. horarum habente, 11. domus, uerbi gratia, spatium tenet
duplum ei quod habet talis domus undecima ascendente Capricæ mo. In regio
nè autem, cuius dies maximus 18. horas æquales complectitur, huiusmodi spacia
11. domus in proportione tripla reperiuntur. Cui ergo persuadetur usquam,
eundem esse influxum tam diuersis quam inæqualibus cœli partibus & siue cœ
lum quiescens posueris, unde uirtutes 12. domiculiorum deriuentur, siue propter
uariam cœli ad faciem terræ habitudinem proprietates domorum distinxeris,
etiam

I. modus æ
quandi
domorum
cœlestium.

etiam domos ipsas ab Horizonte traherentur esse, alteris quidem earum partibus supra Horizontem, alteris autem sub Horizonte manentibus, quod sententia unanimi praeceptorum philosophorum contraria liquet, asserendum sex quidem domos totas supra Horizontem, sex autem sub eo constitui. Praeterea stellam aliquam iam dudum ortam in domo prima imprudens sisset Astrologus, stellam denique longe ab Horizonte occidentali sursum remotam sextae domui Iovis intruderet, quae res quantam & quam horrendam Iudicibus fallaciam ingerant, facile quisque percipiet.

Aliter autem Campano domos distinguere libuit, per circulos videlicet quatuor magnos Horizonti & Meridiano coincidentes in utraque earum communi sectione. Nam super altera huiusmodi sectionum tanquam polo circulum magnum descriptum intelligit per verticem capitis aut regionis transeuntem, huiusmodi quadrantes Meridiano & Horizonte interceptos in trinas aequales sexque partes imaginatur, & per puncta sectionum duci quatuor memoratos circulos, qui una cum Meridiano & Horizonte circulum verticalem ante dictum, scilicet eclipticam ac totum insuper coelum in duodena partiuntur intervalla, sicut hac distinctione, ut quaevis dicta 12. spacia coeli sive corporalia intellexeris, sive superficialia, aequales invicem magnitudines sortiantur eclipticae tamen 12. partes inaequales semper reperiuntur, praeterquam dum poli eclipticae cum duabus Horizontis & Meridiani sectionibus concurrunt, quod accidit in regione cuius latitudo maximae Solis declinationi aequatur. Modus tamen iste quoque alienus sit a methodis antiquorum & quam furtilis, quod circulo verticali imaginario ac nihil utilitatis habenti innititur, silentio praeter reuendum consuemus: ne paulo licentius euagari videamur, cum & maxime plenorem huius negotii resolutionem aliunde expectandam esse iusserimus.

Tertius modus habet medium inter duos memoratos, utroque scilicet eorum participans, diuisit enim quatuor quadrantes Aequatoris Meridiano & Horizonte obliquo interceptos in trinas aequales portiones, & per puncta sectionum ducit quatuor circulos magnos Meridiano ac Horizonte concurrentes in duabus eorum sectionibus: tales itaque sex circuli, assumptis scilicet Meridiano & Horizonte, totum coelum in 12. spacia partiuntur, quae nuncupantur domus. Haec autem domus aequales invicem sunt in omni Horizonte obliquo, tamen suam quaeque seruat magnitudinem inuariabilem. Sic sectiones quidem in Aequatore sumuntur uti in primo modo non in circulo verticali, concursus autem circa locum domus distinguendum fit in sectionibus communibus Meridiani & Horizontis, veluti in secundo modo non in polis mundi. Hac via media secure ac rationabiliter gradiemur, ubi incommoditates duobus modis extrinsecis obijci solitas haud quaquam formidabimus, verum munimenta huiusmodi modi uti cum multa sint, & absque nimis longa digressionem narrari nequeant, missa facimus in praesentiarum, ne disputare potius videamur, quam tabularum nostrarum usum explanare, quod profecto principaliter intendimus.

Hæciant

Hæsitanti autem quocumq; circa traditiones nostras liber secundus problematum almagesti perlegendus est, ubi & fundamenta tabularum nostrarum, & rationes sequandarum domorum ac dirigendorum significatorum, cum plerisque rebus alijs iudicio astrologico conducibilibus abunde exposuimus.

Quomodo
figure coeli
erigenda
sint ratio-
nabiliter.

Nunc ad rem ipsam redeuntibus docebimus, quo pacto in omni habitatione, cuius latitudo 60. gradus non excedit initia 12. domorum coeli cognoscenda sint.

Intra igitur tabellam domorum rationabilem cum latitudine regionis tuæ aut elevatione poli borealis, & duos numeros ex directo eius occurrentes diuisenter sexua seorsum, quorum primus quidem inscribitur numerus polaris 11. & tertie, nonne ac quintæ domorum, secundus autem 12. & secundæ, octauæ ac sextæ. Ille autem numerus polaris notificat arcum circuli magni, qui à polo boreali circulo domum quamuis determinanti ad rectos incidit angulos, deinde uideas cui tabulæ ascensionum obliquarum supra scribitur numerus polaris undecimæ domus, nam ea semper uteris in tua regione ad principia 11. & tertie domorum inuenienda.

Similiter explorandum est, quæ tabulæ ascensionum obliquarum supra scriptam habeat numerum polarem 12. & secundæ, nam illa semper præbebit initia 12. & secundæ domorum.

Hoc pacto ascensionibus rectis loco Solis respondentibus adde gradus Aequatoris à meridie exortos, qui per horas æquales distantie Solis à meridie cognoscuntur, unicuique, uidelicet, horæ 15. gradus tribuendo, & colligetur ascensio recta mediæ coeli, unde & per quintum problema medium coeli scieris.

Deinde ascensionem rectæ mediæ coeli 30. gradus adijcias, & congeries talis erit ascensio obliqua principij 11. domus debita: per tabulam itaque 11. domus, cui uidelicet numerus polaris 11. domus supra scribitur, inuenies arcum eclipticæ dicte ascensionem obliquæ respondentem. Finis enim huius arcus erit initium 11. domus.

Item eidem ascensionem obliquæ 11. domus iunge 30. gradus, & aggregatur erit ascensio obliqua pertinetis ad principium 12. domus. Per tabulam igitur 12. domus quæ arcum eclipticæ debita, & habebis initium 12. domus.

Amplius memoratæ ascensionem obliquæ 12. domus adijcias 30. gradus, & colliges ascensionem obliquam ascendens: Ex tabula ergo regionis tuæ per 9. problema gradum ascendentem & initium primæ domus ad discies.

Postea ascensionem obliquæ ascendens 30. gradus appone, & habebis ascensionem obliquam principij secundæ domus: unde & per tabulam suam modo sepe dicto initium secundæ domus non latebit.

Similiter ascensionem obliquæ secundæ domus 30. gradibus adiectis resultat bit ascensio obliqua tertie domus, ac demum per tabulam suam principio ipsius domus cognoscenda uia parabitur.

In summa sic accipies, ex ascensione recta mediæ coeli per additionem continuam trigonorum graduum nasci solent ascensionem obliquæ reliquarum quinque domorum

domorum per tabulas eis accommodatas suscitatur.

Postquam autem sex domorum capita memoratarum cognoveris, initia reliquarum quoque sex domorum haud quaquam latebunt, cum suam quoque consuetudinem per diametrum circuli aspiciat.

Exemplum huic documento subiungendum est, habeat Sol 6. gradus Tauri, Eximius distans à meridie per tres horas & 14. minuta, uolo inuenire principia 12. domorum caeli ad latitudinem 48. graduum.

In tabella igitur domorum rationabili iuxta 48. gradus latitudinis inuenio numerum polarem 11. & tertiae domorum 29. graduum & 2. minorum, numerum autem polarem 12. & secundae 43. graduum & 53. minorum.

Hos numeros seruo seorsum, deinde per tertium problema inuenio ascensionem Solis rectam 33. graduum & 40. minorum, pro unaquaque autem hora distantiae à meridie accipio 15. gradus Aequatoris, & pro quatuordecim minutis horae unum gradum, uti fieri solet, sicque arcum 48. graduum & 30. minorum colligam, distantiam uidelicet solis à Meridiano, quam addo ascensioni Solis rectae, ut emerget ascensio recta medii caeli 82. graduum & 10. minorum, & ipsum caeli medium 22. gradus cum 40. minutis Geminorum, cui demum ascensionem rectae addo 30. gradus, & resultat ascensio obliqua respondens principio 11. domus 112. graduum & 10. minorum, huic quoque ascensioni obliquae 11. domus addo 30. gradus, & prouenit ascensio obliqua 12. domus 142. graduum & 10. minorum.

Similiter per additionem continuam trigenorum graduum efficio ascensiones obliquas ad initia reliquarum domorum. Primae quidem, cuius initium est gradus ascendens 172. gradus & 10. minuta, secundae autem 202. gradus & 10. minuta, tertiae uero 232. gradus & 10. minuta.

Deinde intro tabulam ascensionum obliquarum 29. gradibus eleuationis positi subiectam, cum ascensionibus, obliquis 11. & tertiae domorum, & per documentum noni problematis inuenio unum gradum cum 28. minutis Leonis pro 11. domo: pro tertia autem 15. gradus & 14. minuta Scorpionis.

Similiter cum ascensionibus obliquis 12. & secundae domorum intro tabulam 44. gradibus suppositam, & eodem modo reperio unum gradum & 4. minuta Virginis pro 12. domo: pro secunda autem 17. gradus & unum minutum Librae.

Non aliter cum ascensionibus obliquis ascendentes, uel primae domus per tabulam regionis uidelicet 48. gradibus subscriptam elicio 14. gradus & 14. minuta Virginis pro ascendente.

Sic inuenta initia sex domorum à medio caeli incipientium, reliquarum autem domorum principia per diametrum praedictis opponuntur: quare & ipsa haud quaquam latebunt. Vfus autem sum 29. gradibus uice 29. graduum & 2. minorum, similiter 44. gradibus uice 43. graduum & 53. minorum, propter uicissitudinem numerorum, cum tabulae ascensionum obliquarum ad integros gradus

sint factæ, hoc etenim pacto nihil erroris sensibilis ingeritur.

Si tamen curiose magis quam utiliter omnia ad unguem exhaurire libet, nonnum problema consulendum est. Iste est modus generalis æquandarum domorum ad omnem poli eleuationem, quamuis nonnihil difficultatis in opere uideatur habere.

Quamobrem si celeriore computationem desideras, hæc tabulam domorum regionis tuæ propriam, secundum modum iam traditum, incipiendo uidelicet à medio cœli uel ascendente, commodius tamen est initium à medio sumere cœli.

Q. VINDECIMUM PROBLEMA.

Duodecim domos cœli per circulos maguos in utroq; polo mundi coeantes ad quamuis latitudinem 60. gradus non excedentem determinare.

ETIAM modum hunc ualde usitatum negligere iam pridem decreuerim, tamen hoc in loco docere libuit, quo pacto secundum eum quoq; domus æquandæ sint uniuersaliter in quacuncq; regione, latitudinem 60. graduum non egrediente: quò abundus siue utilitas, siue amplitudo tabularum præsentium demonstretur.

Modo operationis

Ascensioni igitur rectæ mediæ cœli si à sectione uernali inceperit iunge 90. gradus, & resultat ascensio obliqua ascendens, qua mediante gradus ascendens per tabulam regionis tuæ documento noni problematis innoscet.

Deinde arcum semidurnum ascendens per 12. problema cognoscas, quem diuide in tres partes æquales, eritq; unaquæq; illarum partium dupla ad quantitatatem horæ temporalis diurnæ ipsius ascendens.

Tale autem duplum si dempseris ex gradibus 60. relinquetur duplum horæ inæqualis nocturnæ ascendens, qualiter tuncq; autem huiusmodi duplum horæ inæqualis reperies, nihil refert.

Illud ergo duplum adde ascensioni rectæ mediæ cœli, & resultat ascensio recta principio 11. domui respondens, quæ per quintum problema arcum eclipticæ suum, atq; idcirco initium 11. domus eliciet.

Item ascensioni rectæ 11. domus adde prædictum duplum horæ inæqualis: sic enim ascensionem rectam principio 12. domus debitam constabis, unde & ipsa domus initium fortetur nocturnæ.

Amplius ascensioni rectæ 12. domus prædictum duplum adde, & eruet ascensio recta ascendens, cui horæ nocturnæ adijunge duplum ipsius ascendens, & colligetur ascensio recta initij secundæ domus, cui insuper si idem duplum adieceris, ascensio recta principio tertie domui seruiet prædibit.

Ex his autem ascensionibus rectis si puncta eclipticæ eis respondentia nescires elicere, inertiam tuam turpiter proderes, præsertim cum operatio hæc sit uulgaris admodum, & ante hæc in quinto problemate sufficienter exposita.

Habitis autem initijs sex domorum à medio cœli incipientium, reliquarum quoq; initia diametraliter uidelicet iam memoratis opposita non latebunt.

Si tamen exemplaris computatio placeat, ponatur in medio cœli 12. gradus *Extrema Tauri*: uolo æquare domos secundum hunc modum. Ascensio recta huiusmodi *plum.* mediæ cœli est 39. gradus & 33. minuta, quibus adiungo 90. gradus, resultant 129. gradus 33. minuta, ascensio scilicet obliqua ascendens: & ideo ascendens ipsum 23. gradus & 5. minuta Leonis.

Huius ascendens arcus semidiurnus per prius exposita est 105. gradus et 53. minuta, quem diuido in tres æquales portiones, quarum quæque habebit 35. gradus cum 18. minutis fere, & tantum erit duplum horæ diurnæ ascendens.

Hoc duplum demo ex 60. & relinquuntur 24. gradus cum 42. minutis: duplum igitur horæ diurnæ addo ascensioni rectæ mediæ cœli, quæ erit 39. gradus 33. minuta, resultat ascensio recta 11. domus 74. graduum & 51. minorum.

Cui demum adijeto idem duplum, & emergit ascensio recta 12. domus 110. graduum & 9. minorum.

Huius quoque addo idem duplum ut nascatur ascensio recta ascendens 145. graduum & 26. minorum, omitto autem unum minutum, quia duplum horæ diurnæ deficit parumper in secundis à 35. gradibus & 18. minutis.

Item diætæ ascensioni rectæ ascendens adiungo duplum horæ nocturnæ, scilicet colligo ascensionem rectam secundæ domus 170. graduum & 8. minorum: huic denique aggregato super adiungo prædictum duplum horæ nocturnæ, & resultat ascensio recta tertiæ domus tribuenda 194. graduum cum 50. minutis.

Per istas ascensiones dirigente quinto problemate inuenio pro undecima 16. gradus & 4. minuta Geminorum, pro duodecima 18. gradus & 36. minuta Caneri, pro secunda 19. gradus cum 15. minutis Virginis, pro tertia autem 16. gradus cum 8. minutis Libræ.

Sic cuspides sex domorum orientalium inuentæ sunt: unde & reliquarum sex occidentalium initia propter diametricalem oppositionem innotescunt.

SEDECIMUM PROBLEMA.

Initia duodecim domorum cœli secundum reliquum modum extremum in regione qualibet latitudinem 60. graduum non extendente, breuiter consiluire.

Huius uisæ æquandarum domorum Campanus quidem speculationem exposuit, uerū quo pacto executioni numerariorum mandaretur, silentio præterit: quod profectò uel imbecillitatē huius uisæ, uel difficultatem arguit executionis. Si enim Campanus stabilem arbitratus est hunc modum, quid cum aretere potuit, quo minus artificialē eius usum traderet, nisi ipsa negotij difficultas: aut si calculum eius in promptu habuit, ideo non ædidisse uideretur, quod huiusmodi domorum distinctionem infirmā esse animaduertit: posset tamen subtiliter potius quàm uulter ita imaginari. Ioannes autē Ragusinus sola penitenti auctoritate Campani suffultus cum modum censuit prosequendum: nam cæcærorum astronomorum testimonia, quæ sibi usuuenire arbitretur (pace eius diæxiem)

b a non

non pro sua sed nostra sententia militant, & quidem apertissime, quod a libi latius disseremus. Is igitur postquam opinionem Campani sectari decreuit, documentum ædidi æquandarum domorum, idoneum quidem proposito suo ac Geometricis fundamentis stabilicum, uerum prolixum ac multifarium suspensioneque plenum, adeo ut sine tædio intollerabili ne unam quidem domum quispiam in numeris etiam exercitatissimus elaboraret, quod & Gazulus ille apertè confitetur in quarta parte operis sui circa principium. Sex etenim multiplicationibus sinuum persinus, & item sex diuisionibus ad cuspidem unus domus inueniendam opus est cum plerisque additionibus ac subtractionibus & cautelis multiplicibus. Quamuis itaque huiusmodi domorum distinctio rationabiliter fundata esse, nondum tamen facultatem computandi nacti essemus, quam in presentiarum explanare decreuimus: non tanquam utilem futuram astrologo, uerum potius demonstraturam tabularum nostrarum amplitudinem.

1 modus
computandi.

Intra igitur tabellam domorum secundum Campanum & Gazulum cum eleuatione poli ad tuam regionem, & ex directo eius inuenies interstitium decimæ domus cum numero polari undecimæ, itemque interstitium undecimæ cum numero polari 12. domus, hos numeros serua scorum cum suis inscriptionibus. Appellatur autem interstitium arcus quidam Aequatoris duobus circulis domum quamuis claudentibus interceptus. Numerus uero polaris superius est definitus. Illud tamen non est ignorandum, undecimam & tertiam domum eundem habere numerum polarem, similiter duodecimam & secundam in numero polari communicare.

Quod si congererem interstitiorum decimæ & undecimæ domorum ex 90. gradibus demperis, interstitium 12. domus relinquetur, quod reuera est æquale interstitio primæ domus: interstitium autem secundæ domus æquatur interstitio 11.

Quando itaque libet æquare domos secundum hunc modum, inuenias prius medium cæli, ut assoler, cuius ascensioni recte adiungas interstitium 10. domus, & resultabit ascensio obliqua cuspidi 11. domus respondens, qua mediatrice per tabulam numero polari 11. domus subiectam agnosces punctum eclipticæ memoratæ ascensioni appropriatum, quod solè appellare cuspidem ipsius domus.

Deinde ascensioni obliquæ 11. domus iunge interstitium 11. domus, & colligatur ascensio obliqua 12. domus, cui item adiecto interstitio 12. domus ascensio obliqua primæ domus, aut ascendens prodibit, quam etiam habebis, si ascensionem recte mediæ cæli ab Ariete incipienti quadrantem circuli adsceris.

Si demum ascensioni obliquæ ascendens interstitium primæ domus addideris, ascensio obliqua secundæ domus colligetur: cui tandem interuallum secundæ domus adiunge, & habebis ascensionem obliquam tertie domus.

Vnaqueque autem dictarum ascensionum-obliquarum per tabulam numero polari suæ domus subiectam domus ipsius cuspidem suscitabit cognitam, quem admodum pro 11. domo iam nunc monuimus.

Exemplo autem nullo opus esse reor, quoniam quidem modus iste æquandarum

rum

rum domorum negligendus est. Si tamen exercitij gratia periculum in hoc ne
facere lubet, inuentis ascensionibus obliquis domorum quæ sitarum cum nume-
ris suis polaribus, cuspides earum non aliter quàm in decimoquarto problemate
docuimus, addisce.

DECIMUM SEPTIMUM PROBLEMA.

*Vtrum stella quævis aut punctus eclipticæ quilibet sit in parte cæli orientali
uel occidentali cognoscere.*

P Artem cæli orientalem uoco eam quæ incipit à medio cæli & ad angulum
terræ per ascendentem eundo terminatur, medietatem uidelicet cæli quæ
ad meridiem inspicienti à sinistris existit, reliquam autem medietatem quæ
à dextris est occidentalem.

Subtrahe igitur ascensionem rectam stellæ proposi-
tæ ab ascensione recta me-
dij cæli, ad instans considerationis tuæ, adiecto in e-
gro circulo si opus fuerit, & ab-
relinquetur elongatio stellæ à Meridiano, quæ si minor fuerit semicirculo 180
graduum, stellam ipsam in medietate occidentali dices esse, si autem maior 180
gradibus in orientali: quod sit præcise 180. gradibus complexa fuerit angulum
terræ stella ipsa occupabit, si autem nihil fuerit residuum in medio cæli stellam
esse pronuntiabis.

Exemplum breue, medium cæli habeat 22. gradus & 49. minu. Gemino-
rum, Sol autem in fine 6. gradus Tauri reperiat, uolo tentare propositum huius
problematis de Sole. Ascensio recta medij cæli est 82. gradus & 10. minuta,
ascensio autem recta Solis 33. gradus & 40. minuta, quam minuo ex ascensione
rectæ medij cæli, & relinquuntur 48. gradus cum 30. minutis; scilicet elongatio
Solis à meridie minor semicirculo: quare Solem esse in medietate occidentali cæli
enuncio.

DECIMUM OCTAVUM PROBLEMA.

Vtrum stella sit supra terram aut sub terra faciliter coniectare.

E X anteceditis arcum semidiurnum stellæ ac seminocturnum addisce, deins
de si stella fuerit in medietate occidentali, & elongatio ipsius à meridie mi-
nor arcu semidiurno, stella ipsa supra Horizontem constituetur.

Si autem dicta elongatio à meridie arcum semidiurnum superauerit, sub terra
uerfabitur proposita stella, elongatione demum à meridie & arcu semidiurno
existentibus æqualibus stellam ipsam Horizon occidentalis tenebit.

At si stella medietatem cæli orientalem occupante, demptis 180. gradibus ex
elongatione eius à meridie, relinquetur elongatio eius ab angulo terræ, quæ si
minor arcu seminocturno stellæ extiterit, nondum supra terræ emerisse stellam di-
ces: si aut arcum seminocturnum exsuperit, supra terram proculdubio constituetur.

Quod si arcus seminocturnus elongationi ab angulo terræ æqualis extiterit,
stella ipsa Horizontem orientalem possidebit. Idem aliter experieris ac multo
breuius, si prius ascendentem gradum punctumq; eclipticæ, quo cum stella oritur,
& item punctum cum quo occidere solet, recte didiceris.

Et si n. ap. p. h. u. i. s. e. c. p. q. u. a. s. e. e. s. s. e. s. e. l. l. a. q. u. a. l. i. b. e. t. s. i. t. i. n. p. a. r. t. e. c. a. e. l. i. o. r. i. e. n. t. i. a. l. i. u. e. l. o. c. c. i. d. e. n. t. i. a. l. i. c. o. g. n. o. s. c. e. r. e.

plum.

Hoc enim pacto scies ultra medietatum eclipticæ supra Horizontem aut infra eam existit, et si punctum cum quo stella oritur fuerit in parte orientali, nondum tamen occiderit, scies stellam quoque nondum ortam esse: si autem punctum cum quo occidit fuerit in parte occidentali nondum tamen occiderit, scies stellam nondum quoque occidisse.

Pariter iter conicies stellam esse ortam uel occidisse, secundum habitudinem puncti eclipticæ orti uel occidere solis cum ipsa stella, unde tandem situm stelle, supra terram nē fuerit, an sub terra planè intelliges.

Exempli gratia repetatur situs Solis qui in precedenti ponebatur, cœliq; meridium idem nunc subiiciatur ex duodecimo problemate ad latitudinem 48. graduum, concludo arcum semidiurnum Solis 103. graduum & 32. minorum: erat autem elongatio Solis a meridie 48. graduum & 30. minorum, minor scilicet arcu semidiurno square Solem supra terram esse pronuncio, cætera omnia facilia sunt.

DECIMUM NONVM PROBLEMA.

Distantiam stelle à Meridiano concludere.

Quamuis elongatio & distantia à Meridiano promissæ plerumq; sumantur, in præsentiarum tamen discrimen quoddam eis interiecitimus, quo sermo noster articulator ac lucidior redderetur. In hoc nempe conuenit unè, quod utraq; est arcus Aequatoris condusus inter Meridianum regionis ac circulum per polos mundi & centrum stellæ transcurrentem, uerum elongatio semper à stella uersus Meridianum secundum signorum consequentiam accipitur. Distantia autē nonnunquam contra signorum sequelam in Aequatore perpenditur: distantia deniq; semper aut tota est supra Horizontem, aut tota infra eum, Elongationis autem pars altera supra Horizontem nonnunquam existit, altera autem pars sub Horizonte.

Stigitur stella supra terram existens nondum attigit Meridianum, subtrahit ascensionem rectam mediæ cœli ab ascensione recta stellæ: si autem Meridianum transierit supra terram adhuc existens, ascensionem stellæ rectam ex ascensione recta mediæ cœli demit, & relinquetur distantia stellæ à Meridiano diurna.

Nō aliter computabis distantiam eius à Meridiano nocturnā si sub terra exierit.

Si enim ante Meridianum sub terra fuerit, ascensionem rectam anguli terræ ex ascensione recta stellæ minues: si autem angulum terræ transierit, contra ascensionem rectam stellæ ex ascensione recta anguli terræ minues, relinquetur enim nocturna eius à Meridiano distantia.

Uersa demum uice si stella supra terram existens nondum attigerit Meridianum, distantiam eius à Meridiano ex ascensione sua recta demes, & relinquetur ascensio recta mediæ cœli, aut si ascensionem suam rectam huiusmodi à Meridiano distantia adieceris, stella ipsa Meridianum prætereunte, resultabit ascensio recta mediæ cœli.

Similiter ascensionem rectam anguli terræ deprehendes, si stella talis sub Horizonte deorsū fuerit,

Hinc

Hinc postremo tam coeli medium quam angulum terrae per quintum problema cognoscendi dabitur facultas.

Præterea ascensio Solis recta dempta ex ascensione recta mediæ coeli, adiecto integro circulo ubi opus fuerit, relinquet elongationem Solis a meridie.

Ex qua tandem quot horæ æquales post meridiem effluxerint facile coniectabis, si prius per quindenos gradus memoratam distribuieris elongationem. Hæc breuiter admodum propter sequentia perstringere fuit consilium, ne ampliandi libri potius, quàm res nouas ac utiles rradendi gratia calamum uersalle uideremur, præferim eum alibi res huiusmodi plerisque in locis tractatæ sint, & quidem abundissime.

VIGESIMVM PROBLEMA.

Quantum deuat polus borealis supra circulum positionis stelle cuiusuis, aut alicuius signati puncti in coelo investigare.

Huc huc arrige aures tuas quæcumq; totam dirigendi artem, nec non stellas in 12. coeli domicilijs sistendi artem nancisci uoles, cui negotio nonnullas tabulas exarauimus, quas tabulas positionum particulares appellare habui: quarum unaquæq; in latere suo sinistro geminam habet declinationem, septentrionalem scilicet ac Meridianam usq; ad 12. gradus, tantam enim declinationem planetæ nunquam transiunt, quorû gratia potissimum dictæ tabulæ sunt contextæ. In latere autem superiori uidelicet transversali numeros elevationum poli supra circulos positionum ordinauimus, area uero tabulæ uniuscuiusq; distantias stellarum à Meridiano comprehendit.

Circulum autem positionis appello eum, qui per duas communes sectiones Meridiani & Horizontis, aut per centrum stellæ, aut punctum coeli signatum incedit, quem etiam Horizontem stellæ nonnumquam uocari licebit.

Si igitur stella uel punctus datus supra terram existit, quære declinationem eius in latere sinistro tabulæ ad regionem tuam factæ, in parte quidem superiori si septentrionalis, in parte autem inferiori si meridiana fuerit, et in uerte eius distantiam stellæ à Meridiano, siue ante meridianam fuerit, siue post meridianam, ex directo enim iam dictæ distantia superius in capite tabulæ offendes numerum elevationis poli quæsitum.

Si uero stella aut punctus propositus sub Horizonte exiterit, quære declinationem eius in parte superiori lateris sinistri, si declinatio ipsa meridiana fuerit, aut in parte inferiori si septentrionalis: in area autem tabulæ distantiam stellæ à Meridiano, & secundum modum iam nunc expositum in fronte tabulæ offeretur numerus elevationis poli quem quærebas.

At si stella declinatione caruerit, quærenda erit similiter distantia eius à Meridiano in ultimo uersu superioris paginæ, & ex directo eius in capite tabulæ inuenietur eleuatio poli quæsitæ.

Meminisse tamen debes operandum esse duplici introitu, quando distantia à

Meridiano non integre offenditur in area tabulae, quemadmodum facere solemus per ascensionem rectam arcum eclipticæ ei debitum inuestigaturi.

Si tamen huiusmodi exactam computationem paulo remissius curaueris, uice numerorum tuorum inofficialium accipere poteris numeros eis quàm uicinissimos in tabula saltem expressos, sic enim breuissime ac sine errore notabilipropositum tuum consequeris.

Huius rei gratia sic stella quædam in sine 12. gradus Virginis habens latitudinem septentrionalem trium graduum, atq; idcirco declinationem septentrionalem 9. graduum & 51. minorum, distantia autem eius à Meridiano supra terram sit 53. graduum & 10. minorum uolo experiri quanta sit eleuatio poli septentrionalis supra circulum positionis eius in regione latitudinis 48. graduum, si declinatio stellæ fuisset præcise 10. graduum, & distantia à Meridiano 52. grad. cum 37. minutis, inuenissem 38. gradus eleuationis poli in fronte tabulae, uerum declinatio non habet plene 10. grad. sed propinqua est 10. gradib. quare intrant mihi cum 10. gradib. partem tabulae superiorem occurrit distantia à Meridiano proximo minor proposita distantia 52. graduum et 37. minorum, proximo autem maior 55. graduum & 2. min. differentia harum distantiarum est 2. gradus & 25. minuta, quæ correspondent uni gradui eleuationis poli: hanc differentiam pono pro primo numero. Item minorem distantiam 52. grad. 37. min. subtraho à distantia proposita 53. grad. & 10. minu. & relinquuntur 33. minuta pro secundo numero.

Tertius autem numerus semper est 60. minuta, duco igitur secundum in tertium, nascuntur 1980. secunda, quæ diuido per 145. minuta æquipollentia duobus gradibus & 25. minutis exeunt scilicet 14. minuta, addenda 38. gradib. eleuatio itaq; poli supra circulum positionis stellæ est 38. graduum et 14. minorum.

Quod si adhuc præcisius habere uolueris huiusmodi eleuationem poli eleuatione tua habente minuta iuxta gradus, intra primo cum declinatione & distantia a meridie in tabulam positionum proxime minorem, extrahendo eleuationem poli, ut iam dictum est, deinde cum declinatione eadem & distantia a meridie, in tabulam positionum proxime maiorem, & similiter eice eleuationem poli. De differentia autem harum eleuationum accipe partem proportionalem secundum proportionem minorum existentium iuxta gradus latitudinis poli, quam adde primæ eleuationi si secunda maior fuerit ea, aut minue ex ea si secunda fuerit minor. Hoc enim pacto exactius comprehendes eleuationem poli quæsitam.

VIGESIMVM PRIMVM PROBLEMA.

In qua 12. domorum caeli stella queuis aut punctum caeli quodlibet constituitur, explorare.

DE stella semper intelligas aut puncto caeli declinationem 31. graduum non egrediente.

Postquam igitur ex ante memoratis initia 4. domorum angularium congnoueris, itemq; puncta eclipticæ cum quibus stella proposita & oritur & occidit, ac

dit, ac eorum mediat, aperte contemplantur, sit ne stella in aliquo dictorum angulorum an non.

¶ Ac si nullum istarum angulorum obtinuerit, scies in qua quartarum coeli dictis punctis angularibus interceptarum consistet, ut autem domus eius inueniatur, hoc accipe praeambulum.

¶ Domus undecima & quinta, item nona & tertia, quamuis duobus circulis positione differentib, determinentur, polus tamen borealis aequaliter ab utroque eorum remouetur.

¶ Similiter duodecima & sexta, item octaua & secunda per duos circulos positione diuersos cognoscuntur, uerum tamen polus borealis aequaliter supra utrumque eorum eleuatur.

¶ Cognito itaq; ex praecedenti quantum polus borealis supra circulum positus alicuius stellae eleuatur, confer numerum huiusmodi eleuationis ad numeros polares 11. & 12. domorum per quantum decimum problema repositos, nam si fuerit aequalis numero polari 11. domus, & stella ipsa in quarta orientali diurna manserit, cuspidem undecimae necessario occupabit.

¶ Si autem in quarta orientali subterranea fuerit, in cuspide tertiae domus constituetur, ac si numeris praedictis sese non excedentibus stella quartam occidentalem sublimem tenuerit, in principio nonae domus procul dubio reperietur.

¶ Si uero in quarta occidentali subterranea extiterit, cuspidem quintae domus eam obtinere necesse est.

¶ Sed si eleuatio poli supra circulum stellae positionis numerum polarem 12. domum aequauerit, eo ordine ac modo ut iam pridem coniectauimus stellam esse aut in principio 12. aut 3. aut 8. aut 6. domus. In principio uidelicet alicuius dictarum domorum, quae cum stella proposita in eadem quarta collocatur.

¶ Quod si eleuatio poli supra circulum positionis stellae non fuerit aequalis alteri duorum numerorum polarium praefatorum, certum est stellam non esse in cuspide alicuius domorum memoratarum: unde si minor fuerit numero polari 11. domus, constabit stellam esse in 10. domo uel 9. uel 4. uel 3. prout quarta stellam ipsam tenens edocebit.

¶ Si uero dicta eleuatio maior fuerit numero polari 11. domus, minor tamen numero polari 12. stella erit aut in 11. aut 8. aut quinta aut secunda. Si autem eleuatio poli saepe memorata excederit numerum polarem, 12. domus, stellam ipsam aut in 12. aut 6. aut 7. aut prima, modo supra scripto, comperies.

¶ Poteris etiam aliter experiri stellam quamuis prope cuspidem alicuius domus existentem secundum locum longitudinis suae, sit ne ante cuspidem an post eam, aut in ipsa in cuspide, praesertim si habuerit latitudinem, quam si non habere nulla specialis doctrina opus esset.

¶ Nam si stella fuerit prope medium caeli aut angulum terrae, punctus eclipticae declinationis stellae comparatus ad medium caeli aut angulum terrae, te reddet in haec certiorum. Si autem prope ascendentem fuerit, punctus eclipticae cum quo stella uisibilis id edocebit.

Idem faciet punctus eclipticæ cum quo stella solet occidere, si circa gradum occidentem stella exiterit.

Si autem circa cuspidem alicuius domorum orientalium inuenta fuerit, scita deuotione poli supra Horizontem eiusdem domus, circulum dico qui determinat initium talis domus, per tertium decimum problema quære punctum eclipticæ, cum quo oritur stella proposita supra Horizontem eiusdem domus, illud enim punctum cuspidi domus collatum, stellæ situm respectu memoratæ cuspidis demonstrabit.

Non aliter argumentaberis per punctum eclipticæ cum quo stella occidit sub Horizonte alicuius domorum occidentalium, eius uidelicet iuxta cuius principium stellam tuam offenderis. Nolim b. lector multitudine uerborum absterrearis, facillimam enim ipse constitueris operationem expositam, ubi mediocri prius exercitatione fueris usus.

Exemplum.

Exemplo tamen breui tranquilliores animum tibi reddam. Stella præcedens ris problematis habuit eleuationem poli supra circulum positionis suæ 38. graduum & 14. minorum, ponatur ipsa in quarta orientali diurna, ex quarto estimo autem problemate ad latitudinem 48. graduum didici numerum polarem undecimæ domus 29. graduum & 2. minorum, numerum autem polarem duodecimæ 41. graduum & 53. minorum: cum iteq; eleuatio poli supra circulum positionis stellæ sit maior numero polari undecimæ domus, minor autem numero polari duodecimæ, concludo stellam esse in 11. domo. Similiter in casibus te expedies.

VIGESIMUM SECUNDUM PROBLEMA.

Virum due stelle utruq; propositæ in uno circulo positionis leuant explorare.

Coniunctio
nes stelle
FIN

Tribus modis stellarum coniunctiones Astronomi considerant, primum quidem secundum circulos per polos eclipticæ incedentes, quando uidelicet unus talis circulus ambas complectitur stellas.

Secundo, secundum circulos per polos mundi incedentes.

Tercio autem secundum circulos Meridiano & Horizonti in duabus eorum sectionibus coeuntes. Hoc genus coniunctionum Hali expofitor quadripartiti Ptolemæi diligenter obseruare solet, quod magnè in nauicantibus uim habeat.

Huiusmodi igitur coniunctionem in hoc proposito quærere instituimus, Sicut uidelicet stellæ propositæ in uno tali circulo an non.

Id autem per uigesimum problema experiri nudum est.

Nam si stellis propositis una & eadem fuerit eleuatio poli borealis supra circulum positionis, coniunctas modo prædicto enuntia bimus, si uero diuersæ fuerint eleuationes poli supra circulos positionum, non erunt coniunctæ. Oportet autem ante omnia stellas ipsas in una & eadem quatuor quartarum Meridiano & Horizonte distinctarum constitutas esse.

Simili argumento utemur circa quæcunq; duo puncta cœli, quando eorum coniunctionem scire desideramus. Nullo hic exemplo opus esse reor propter facilitatem problematis.

Vigésim

VIGESIMVM TERTIVM PROBLEMA. 13

Oblatis duobus stellis aut duobus punctis caeli possint ne modo praedicto coniungi infra diem unum naturalem, perscrutari.

SCito primum utriusque stellae declinationem ac ascensionem rectam: deinde subtrahere ascensionem rectam unius earum ab ascensione recta alterius, & relinquetur differentia huiusmodi ascensionum rectarum, quam uocabimus interuallum aequinoctiale, id autem interuallum minus esse debet semicirculo.

Nam si maius eueniret conuersim agendum esset, minuendo uidelicet ascensionem à qua prius facta fuit subtractio, ex reliqua accommodato integro circulo si opus fuerit: si autem huiusmodi interuallum semicirculo aequale esset stellae propositae, nequaquam modo praedicto coniungi possent.

Confidera demum utra stellarum prior ad Meridianum perueniat, quod per ascensiones earum rectas facile conijces, eam etenim praecedentem appellabimus, reliquam autem sequentem.

Praeterea sciendum utra earum polo boreali uicinior existat, quod quidem ex declinationibus earum adiffices. Nam si aequales & ad eandem partem Aequatoris habuerint declinationes, non erit earum coniunctio possibilis, nisi etiam sis mul secundum longitudinem Zodiaci coniungantur, quod genus coniunctionum in praesentiarum nobis non est curae.

His ergo sic praestitis, quaere utriusque stellae declinationem in latere sinistro tabulae positionis ad regionem tuam factam, notando etiam partem declinationis utriusque, primo quidem supra terram, deinde autem sub terra, & ex directo utriusque declinationis percurrere omnes numeros distantiarum à Meridiano usque ad finem tabulae. Nam si sub una & eadem elevatione poli duas distantias à meridie inuenieris, quarum differentia aequalis fuerit interuallo equinoctiali superius seruaturo, possibilis erit dictarum stellarum coniunctio. Item si inuenieris duas huiusmodi à meridie distantias minus dicto interuallo aequinoctiali differentes, & alias duas praedictis immediatas plus eo interuallo differentes, iterum possibilitatem coniunctionis praedicabis.

Ut autem scias in qua parte caeli coniunctio talis eueniet, illud accipe argumentum. *In qua parte*
Quando stella praecedens meridionalior est sequente, & pars declinationis accepta est supra terram, memorata coniunctio erit in quarta orientali supraterrae. *terce: i co*
Quaerendum uero praecedens stella septentrionalior existit in quarta occidentali sub- *iuunctio su*
praterterranea, coniunctionem euenire necesse est. *at.*

Si autem partem declinationis sub terra acceperis, & stella praecedens septentri-
onalior fuerit, quarta occidentalis subterranea ipsam coniunctionem habebit, parte
se declinationis sub terra si fueris usus, et stella praecedens meridionalior extiterit,
in quarta orientali subterranea procul dubio tali coniunctioni locus uidebitur.

Horam praeterea memoratae coniunctionis operae precium est agnoscere.

Per distantiam igitur utriusque stellarum à Meridiano ac ascensionem eius
rectam

rectam, ascensionem quoque rectam medijs poli cognoscere, ex qua demum & ascensionem Solis recta, decimonono problemate dirigetur, horas à meridie usque ad instantis dictæ coniunctionis exactas docere computabis.

Elevationem poli autem borealis supra circulum positionis, in qua stellas ipsas coniungi oportebit, directe supra distancias stellarum à Meridiano in fronte tabulæ offendetis.

Quod si unus quidem excessus distanciarum à Meridiano minor fuerit interuallo æquinoctiali supradicto, alter autem maior eo, atque idcirco coniunctio stellarum possibilis, uti paulo ante recitauimus, uolueritis scire elevationem poli borealis supra circulum positionis, in quo coniungentur, subtrahite minorem excessum distanciarum à maiore excessu distanciarum à meridie, & residuum uocatum primum.

Deinde excessum distanciarum repertum sub minore elevatione poli confer ad sepe dictum interualli æquinoctiale, differentiamque eorum pro numero secundo statuertis, atque numerus in hoc negotio semper erit sexagenarius minorum.

Duciteque secundum in tertium, et productum partire per primum, notata diligenter denominatione, quemadmodum in alijs similibus operationibus fieri solet, exhibit enim numerus minorum ad elevationem poli minorem addendorum.

Hoc pacto elevationem poli supra circulum positionis stellas ipsas coniungentem rationabiliter computabis.

Distanciam autem utriusque stellarum à Meridiano pro instanti talis coniunctionis hac lege scrutaberis:

Vide quantum duabus distantijs proximis alterius duarum stellarum intercessit, distantijs inquam, quas ante hoc tractauimus, acceptamque partem proportionalem de differentijs earum secundum proportionem minorum elevationis poli nuper inuencorum ad 60. adicias primæ distantiæ à Meridiano si minorem secunda offendetis, aut ab ea minue, si maiorem.

Quicquid enim congregabitur uel relinquetur, prout res ipsa postulat, distanciam stellæ à Meridiano pro instanti coniunctionis patefaciet.

Voco autem primam distanciam à Meridiano eam, quæ sese lectori prius offert à latere sinistro tabulæ dextram uersus eunti, quæ uidelicet elevationem poli minorem supra se habet.

Exempli gratia, habeat stella quædam 2. gradus Virginis cum latitudine meridionali 3. grad. alia autem in fine quarti gradus Virginis reperiatür cum latitudine septentrionali unius gradus: Sol uero 7. gradum Canceri obtineat, pido explorare an dictæ stellæ possint coniungi infra diem naturalem in regione habente latitudinem 48. graduum, & si coniungentur, qua hora id futurum sit.

Prima stella per primum problema habet declinationem septentrionalem 8. grad.

Secunda uero declinationem septentrionalem 1. grad. Item per tertium problema prima habet ascensionem rectam 152. grad. & 53. minorum, secunda autem 156. grad. & 16. minorum, subtrahite itaque alteram dictarum ascensionum ab altera minorem

minorem scilicet à maiore, & relinquuntur 3. gradus cum 21. minutis, quos appello interuallum æquinoctiale.

Cum autem ascensio recta primæ stellæ sit minor ascensione recta secundæ stellæ, necesse est primam stellam prius peruenire ad Meridianum quam secundam: primam ergo uocabo præcedentem, & secundam sequentem. Est autem præcedens stella meridionalior sequente, id est, minus distat à polo australi quam secunda: cum declinatio eius septentrionalis minor sit declinatione septentrionali sequentis stellæ.

Quero itaque declinationes dictarum stellarum in latere sinistro tabulæ positionum ad 48. gradus latitudinis, ac si stellæ sint supra terram, & ex directo earum transcurrente binas earum à meridie distantias sub elevatione poli 46. graduum reperio distantiam præcedentis à meridie 77. graduum & 10. minutorum, distantiam autem sequentis 80. graduum & 25. minutorum.

Harum distantiarum excessus est 3. gradus & 15. minuta, qui si fuisset gradus tres 21. minuta, iam concluderetur possibilitas conjunctionis futuræ in circulo supra quem polus eleuatur 46. gradibus: Sed quoniam dictus excessus minor est interuallo æquinoctiali, transeo ad sequentes duas distantias, quarum una scilicet stellæ præcedentis est 83. gradus & 35. minuta, alia autem stellæ sequentis est 86. gradus & 57. minuta.

Excessus harum distantiarum est 3. gradus & 22. minuta, maior uidelicet interuallo æquinoctiali: quare concludo stellas memoratas coniunctum iri.

Cum autem præcedens stella meridionalior sit stella sequente, & declinationes acceptæ sunt ac si stellæ supra terram existant, coniunctio earum erit in quarta orientali supra terram.

Ut autem instans conjunctionis mihi innotescat, prius inuenio elevationem poli supra circulum positionis in quo continguntur, hoc pacto.

Excessus primarum distantiarum est 3. gradus & 15. minuta, excessus autem secundarum est 3. gradus & 22. minuta, quorum differentiam scilicet 7. minuta statuo pro primo numero. Item excessum primarum distantiarum minuo ex interuallo æquinoctiali, & relinquuntur 6. minuta pro secundo numero: tertius autem semper est 60. minuta, duco secundum in tertium, producentur 360. secunda, quæ diuido per 7. minuta, & exeunt 51. minuta fere, addenda gradibus elevationis poli, qui ponuntur directe supra primas distantias. Sic ergo comprehendendo quòd polus borealis eleuatur 46. gradibus & 51. minutis supra circulum positionis, in quo coniunguntur memoratæ stellæ: deinde subtraho primam distantiam stellæ præcedentis à secunda eius distantia, & remanent 6. gradus cum 25. minutis, quarum pars proportionis secundum proportionem 51. minutorum ad 60. est 5. gradus 27. minuta, eam partem proportionalem addo distantie stellæ præcedentis, resultant 82. gradus & 37. minuta: tantamque dico esse distantiam stellæ præcedentis à meridie, pro instanti conjunctionis ipsarum stellarum: quam distantiam demo ex ascensione recta stellæ præcedentis, & relinquuntur ascensio recta.

recta mediꝝ cœli 70. graduum & 18. minorum . Ascensio autem recta Solis est 97. gradus & 38. minuta, quam demo ex ascensione recta mediꝝ cœli, accommodatis 360. gradibus, & remanet elongatio Solis à meridie 332. graduum & 40. minorum, qua diuisa per 15. exeunt 22. horæ & 11. minuta, quibus à meridie transfactis calcm coniunctionem fieri necesse est . Hoc autem pro corollario tenendum est, quòd quælibet duæ stellæ propolitz, aut penitus non coniungentur modo prædicto, aut his coniungentur infra diem unum naturalem: semel quis dem supra terram, & semel sub terra. Vnde si cum declinationibus assumptarum stellarum ingressus fueris tabulam, ac si stellæ sint sub Horizonte, reperies, quòd ipse coniungentur sub terra in circulo, supra quem polus eleuatur 46. gradibus & 51. minutis, quem admodum iam pridem accidebat.

VIGESIMVM QVARTVM PROBLEMA.

Dato quocunq; ascendente in Horizonte qualibet reliquarum domorum initia artificialiter elicere.

Supertus traditum est quo pacto 12. cœli domicilia rationabiliter constituantur, sumpto exordio ab angulo mediꝝ cœli: ibi enim per additionem continuam trigenerum graduum ad ascensiones rectas mediꝝ cœli ascensiones obliquas initijs reliquarum domorum respondentes, ac demum per tabulas singulis domibus appropriatas ipsarum domorum principia didicimus: hic autem dato ascendente ex tabula regionis per septimum problema ascensiones eius obliquas hauriemus, a quibus si 30. gradus reiecerimus, ascensio obliqua initio 12. domus debita relinquetur . Item ab eadem ascensione obliqua duodecimæ domus 30. gradus adiecti ascensionem obliquam undecimæ domui pertinentem relinquunt, quod si adhuc 30. gradus dempseris, ascensionem rectam mediꝝ cœli residuam conspicias . Atq; trigenerum graduum additione continua super ascensiones obliquas ascendentes primæ & secundæ domorum, obliquæ ascensiones constari solent.

Superuacaneum autem uidetur demuo mouere, quo pacto præfatarum domorum principia per ascensiones suas obliquas inuestigentur, cum ante hac in quatuordecimo problemate id satis explanatum sit. Quamuis itaq; memorati negotij gratia præfens problema ædidisse uideamur, terrore uerborum id persuadente, longe tamen spectabilio rem metam cursui nostro obiectare arbitrati sumus, quæ ut cognitu facilius reddatur, paulo distantius ordiendum est.

Solent egregij astrorum iudices uitam parentum ex genitura filij primogeniti, & e contra diiudicare, statuendo uidelicet locum Solis quidem in natiuitate diurna filij, locum aut Saturni in nocturna tanquam ascendentem patris, itemq; locum Veneris quidem in genitura diurna, Lunæ autem locum in nocturna pro ascendente matris: hinc omnium domorum cœli elidunt ordinem, accidentiaq; parentibus obuentura pronunciant. Non aliter faciunt pro moribus fratrum, filiorum, uxoris, amicorum ac inimicorum discernendis, ponendo uidelicet singulorum

vsu huius
proble-
matis.

gulum significatoris pro ascendente, quæ res quanti sit momenti uix paucè dare possemus: id ergo altunde petendum silentio præteritus, ad coeptum negotium principale descenduri.

Cum itaq; figura patris (uerbi gratia) erigere uolueris, & Sol (nascente filio) fuit in ascendente: non erit figura patris diuersa à figura filij.

Si autem Sol in Meridiano exciterit, adde ascensioni rectæ Solis 30. gradus, & habebis ascensionem rectam principij secundæ domus pro figura patris. Item ascensioni rectæ secundæ domus adde 30. gradus, et congregabitur ascensio recta principio tertie domus debita.

Similiter per additionem continuam trigenorum graduum habebis ascensiones rectas quartæ domorum, quintæ & sextæ, unde per quintum problema principia dictarum domorum, & deinde domorum oppositarum cognosces.

Sole autem in angulo occidentis constituto, cuspides domorum in figura patris non different à cuspidibus domorum filij, uerum aliud erit principium numerationis domorum: septima enim filij erit prima patris: octaua autem filij pro secunda patris accipietur, & ita de reliquis ex ordine.

Quòd si Sol in genitura filij angulum terræ occupauerit, non aliter quàm si in medio cœli esset operabimur.

Significatore autem paterno nullum dictorum angulorum tenente, eleuationem poli borealis supra circulum positionis in quo iacet significator, qui circulus Horizon etiam significatoris appellabitur, per uigesimalum problema addidissas, & si fuerit dictus significator in medietate cœli orientali secundum Horizontem regionis, quære ascensionem obliquam eius in Horizonte suo per septimum problema: item numeros polares domorum ad eundem Horizontem, quibus rebus comprehensis, per ea quæ in principio præsentis documenti exposuimus 11. cœli domos artificiosè constitues.

Si autem significator patris fuerit in medietate cœli occidentali, accepta eleuatione poli supra Horizontem eius, numericisq; polaribus domorum inuentis ad eundem Horizontem quære ascensionem eius obliquam ad Horizontem suum. Deinde autem non aliter procede quàm ante hæc de Sole præcepimus, quando in occidentali Horizonte filij ponebatur.

Memento tamen exposita hætenus duntaxat ueritatem tenere, quando significator huiusmodi latitudine prorsus caret.

Nam si latitudinem quantamcumq; haberet, inuentà eleuatione poli supra circulum positionis suæ, aut Horizontem suum, quære punctum cum quo oritur in eodem suo Horizonte, si fuerit in medietate orientali, aut punctum cum quo occidit in Horizonte suo, si fuerit in medietate cœli occidentali: deinde cum illis punctis ædificæ procedas, quemadmodum antea fecisti cum significatore non habente latitudinē. In exemplo sit genitura alicuius filij primogeniti 13. horis et 20. minutis à meridie transactis secundū dies æquatos in regione habente latitudinem 48. graduum Sole existente in fine 26. gradus Cancrī: uolo constituere locū

Soliæ

Exemplum.

Solis pro ascendente patris & exinde totam domorum figuram elicere; Subtrahat 23. horas & 29. minuta à 24. horis, remanent 31. minuta unius horæ, quæ æquipollent 7. gradibus & 45. minutis æquatoris, aut paralleli Solis, quare dico Solem distare à Meridiano versus orientem 7. gradibus & 45. minutis.

Declinatio autem Solis septentrionalis erit 21. graduum: cum qua & prædicta distantia Solis à Meridiano ingreditur tabulam positionis ad 48. gradus latitudinis, & secundum documentum 20. problematis inuenio elevationem poli borealis supra circulum positionis Solis 6. graduum, eo autem circulo positionis deinceps utar tanquam Horizonte regionis habentis latitudinem 6. graduum.

Intra igitur tabellam domorum rationalem cum 6. gradibus elevationis poli, & ex directo eorum inuenio numerum polarem undecimæ 3. graduum, numerum autem polarem duodecimæ 5. graduum & 11. minutorum, quorum usque accipiam 5. gradus propter breuitatem.

Ascensio obliqua Solis ad latitudinem 6. graduum est 115. gradus & 42. minuta à qua ascensione subtrahat 30. gradus, & remanent 85. gradus cum 42. minutis, pro ascensione obliqua duodecimæ domus patris: item ex ascensione obliqua qua 12. minu. 30. gradus, remanent 55. gradus & 42. minuta pro ascensione obliqua undecimæ, à qua demum subtractis 30. manent 25. gradus cum 42. minutis pro ascensione recta decimæ domus.

Rursus per continuam additionem trigentorum graduum ad ascensionem obliquam ascendens, scilicet loci Solis, elicio ascensionem obliquam. 2. domus 145. graduum & 42. minutorum, ascensionem autem obliquam 3. domus 17. graduum & 42. minutorum.

Ex illis autem ascensionibus inuenio cuspides dictarum domorum, eisq; diametraliter posituram, quemadmodum in 14. problemate traditum est: decimæ quidem 27. gradus & 41. minuta Arietis, undecimæ autem 29. gradus, cum 2. minutis Tauri, duodecimæ 28. gradus & 4. minuta Geminarum, secundæ 24. gradus & 35. minuta Leonis, tertix uero 25. grad. & 25. minuta Virginis

VIGESIMVM QVINTVM PROBLEMA.

Significatorem quemlibet ad locum propositum quemcumq; secundum signorum seriem dirigere.

Dirige
re.

Priusquam ad operationem descendatur, nonnulla uocabula præsentis negotij diffinienda sunt. Dirigere non est aliud quam mouere spheram, donec locus secundus traducitur ad situm primi: id autem tunc accidere Ptolemaeus clarissimus asserit, quando locus secundus perducitur ad circulum in quo situit locus primus, aut è contra locus primus transfertur ad circulum in quo ponebatur locus secundus.

Circulum dico coincidentem Meridiano & Horizonti in utraq; eorum communi sectione, quem superius circulum positionis appellare libuit.

Locum autem primum uoco eum, cuius notitia prior in mentem uenit, aut quem

quem dirigere subter: locus uero secundus est is, ad quem dirigitur primus.

Locus primus plerumque uocari solet significator, quod alicuius rei habitudinem in caelo representat, locus autem secundus non iniuria promissor appellabitur, quod futurum aliquod accidens siue bonum siue malum portendat. Significator itaque habet uicem subiecti recepturi aliquid a promissore in certo tempore, cuius quidem temporis quantitatem directio metiri solet, quemadmodum iudicibus placet.

Directio autem est motus primi mobilis, quo uidelicet significator traducitur ad situm promissoris, aut e contra.

Directio.

Solet tamen ut plurimum accipi directio pro arcu Aequatoris, qui coascendit uel condescendit interuallo, quod est inter significatorem & promissorem respectu circuli positionis, in quo alter eorum iacet: unde & dirigere tunc dicimus quando huiusmodi arcum docte numerabimus.

Duplicem autem directionem distinguere solent Astrologi, quarum una quidem uocatur directio directa, in qua uidelicet locus secundus, id est promissor, intelligitur transferri ad situm primi, id est significatoris. Dicitur etiam directio secundum signorum successionem.

Duplex di-
rectio.

Alia autem uocatur conuersa, aut contra successionem signorum, in qua locus primus intelligitur transferri ad locum secundum: hac secunda directione utuntur iudices pro parte fortunae ac alijs partibus, & pro planetis retrogradis.

Quando igitur significator in Meridiano constituitur siue supra terram, siue sub terra, subtrahit ascensionem eius rectas ab ascensionibus rectis promissoris, accommodato integro circulo 360. graduum si opus fuerit, & relinquetur directio significatoris quaesita.

Operatio.

Si autem fuerit in ascendente, minuet ascensionem eius obliquam ex ascensione obliqua promissoris: sic enim reliqua manebit directio significatoris quaesita.

Non aliter operaberis per descensiones si significator fuerit in occidente: subtracta enim descensione obliqua significatoris a descensione obliqua promissoris, relinquetur directio quaesita.

Verum si significator non fuerit, in aliquo dictorum angulorum, per 19. problema scias distantiam eius ab angulo medij caeli, si fuerit supra terram, aut ab angulo terrae si sub terra extiterit.

Deinde per 10. problema eleuationem poli borealis supra Horizontem significatoris, aut circulum positionis addiscas, postea ad eandem eleuationem poli computa ascensionem obliquam significatoris, per septimum quidem problema, si latitudine caruerit significator ipse, per decimum autem si quam habuerit latitudinem.

e Similiter

Similiter ad eandem elevationem poli, ascensio obliqua promissoris inueniatur: demptisq; ascensione obliqua significatoris ex ascensione obliqua promissoris, residuum numerabit directionem quaesitam.

Si autem significator fuerit in parte occidentali coeli, descensio obliqua significatoris ad eandem elevationem poli supra circulum positionis accepta, per octauum quidem problema si nullam habuerit latitudinem, per undecimum autem si quam habuerit latitudinem: descensio inquam minuenda est ex descensione obliqua promissoris eodem modo accepta, sic enim relinquetur directio quam quaerebas. Nulla prorsus exemplari computatio ne hic est opus, si ea, quae circa ascensiones ac descensiones iam dudum monuimus, & operati sumus, recte didicisti.

VIGESIMVM SEXTVM PROBLEMA.

Quo pacto significator quispian contra signorum successionem dirigendus sit lucubrare.

Directio significatoris cuiuspiam contra signorum successionem similis est directioni secundum signorum consequentiam, hoc uno considerato, quod ascensiones & descensiones accipiantur secundum positionem promissoris, & non significatoris, ac si promissor dirigendus esset ad locum significatoris.

Sic enim subtrahemus ascensiones rectas promissoris ab ascensionibus rectis significatoris, si in Meridiano constitutus fuerit promissor: ascensiones autem obliquas promissoris ad latitudinem regionis sumptas ab ascensionibus obliquis significatoris, si promissor in ascendente iauerit, aut descensiones huius à descensionibus illius si angulum occidentis tenuerit promissor, & relinquetur directio expectata.

Quod si nullus dictorum angulorum promissorem habuerit, inuenta prius elevatione poli borealis supra circulum positionis suae, subtrahemus ascensiones obliquas ipsius, ad eandem poli elevationem sumptas ab ascensionibus obliquis significatoris, si in medietate orientali fuerit promissor: aut descensiones eius obliquas à descensionibus obliquis significatoris ad eandem poli elevationem acceptis, accommodato integro circulo 360. graduum, quotiens opus fuerit, quod enim relinquetur, directionem ostendit quaesitam.

VIGESIMVM SEPTIMVM PROBLEMA.

Ad quem locum Zodiaci directio significatoris cuiuspiam secundum signorum successionem perueniat, in aliquo anno proposito inuestigare.

SI in radice nauitatis uel alterius principij fuerit significator in Meridiano, siue supra terram, siue sub terra, ascensionem rectam eius adde numerum annorum transactionum ab instanti talis radicit, id est pro quo libet anno exacto unum gradum Aequatoris dictae ascensionem rectam adicias, & aggregati tanquam ascensionis rectae quaerit arcum eclipticae, relecto prius integro circulo si opus fuerit, directio enim significatoris memorati in anno sequenti eos annos quorum numerus additus est ascensionem rectam praefatae perueniet ad gradum qui sequitur immediate arcum eclipticae iam inuentum.

Si autem significator fuerit in ascendente, numerum annorum transactionum adde ascensionem obliquam significatoris ad regionem propositam: aggregatum enim erit ascensio obliqua cuiusdam arcus eclipticae, cui immediate annexitur gradus ad quem perueniet directio.

Cum igitur arcum eclipticae per tabulam regionis agnoscas, non aliter operaberis per descensiones significatoris si in occidente extiterit: numero enim adiecto descensionibus obliquis significatoris prodibit descensio obliqua arcus eclipticae terminali, ad gradum directionis quaesitum.

At si significator extra angulos dictos repertus fuerit, cognoscenda est eleuatio poli borealis supra circulum positionis aut Horizontem eius: deinde ascensionibus obliquis eius ad Horizontem eundem addatur numerus annorum propositorum, si in medietate orientali manserit significator: aut descensionibus eius in eodem Horizonte, si in occidentali parte coeli iacuerit. Hoc enim pacto constabit uel ascensionem obliquam, uel descensionem arcus eclipticae quem immediate sequitur gradus directionis quaesitus: huiusmodi autem arcum eclipticae per tabulam Horizonti significatoris seruientem, ac deinde gradum ad quem perueniet directio, facile concludes.

VIGESIMVM OCTAVVM PROBLEMA.

Quo pertingat directio significatoris propositi contra successionem signorum in anno quocumq; explorare.

Cognito prius arcu semidiurno significatoris cum arcu seminocturno per duodecimum problema, subtrahere numerum annorum exactorum ab ascensione recta significatoris, itemque residuum ab ascensione recta medij coeli, accommodato integro circulo ubi opus fuerit, & reliquum numerabit elongationem significatoris a meridie, quam habet dum positio sua similis est positioni promissoris, id est gradus quaesitum.

Huiusmodi igitur elongationem, si minor fuerit arcu semidiurno significatoris, pro distantia à Meridiano supraterranea occidentali tenebis.

Si uero maior arcu semidiurno significatoris fuerit, minor tamen semicirculo eam ex semicirculo deme, & relinquetur distantia significatoris à Meridiano subterranea occidentali.

At si maior fuerit semicirculo, semicirculus ex ea minuat, & residuum si minus arcu seminocturno extiterit, pro distantia à Meridiano subterranea orientali computetur.

Si autem arcum seminocturnum exellerit, dempto eo ex semicirculo, quod relinquetur distantia à Meridiano supraterranea orientali nuncupabitur.

Iam igitur cum declinatione significatoris & distantia à Meridiano per uigefimum problema elevationem poli borealis supra circulum positionis addideris, ac deinde ascensionem obliquam significatoris, per septimum quidem problema si latitudine caruerit significator, per decimum uero si quam habuerit latitudinem, quemadmodum superius explanatum est, si saltem memorata distantia à Meridiano fuerit orientali.

Ex hac demum ascensione obliqua minue numerum annorum ab instanti radice transactorum, & residuo, tanquam ascensioni obliquae congruentem arcum eclipticæ elicias per nonum problema. Nam ad gradum finalem huius arcus eclipticæ perueniet directio significatoris in anno propositio.

Si autem sæpe nominata distantia à Meridiano fuerit occidentalis, accipe descensionem obliquam significatoris, per octauum quidem problema si latitudine caruerit, per undecimum autem si latitudinem quantamcunque habuerit: ex qua denique descensione obliqua minue numerum annorum exactorum, à tempore radice usque ad annum propositum exclusiue: & residuum erit descensio quedam obliqua, cui per nonum problema arcum eclipticæ elicias, nam gradus eius terminalis erit locus directionis quem petebas.

Exemplum.

In exemplo habeat pars fortunæ 25. gradus Virginis, in genitura cuiusdam hominis ad latitudinem 48. graduum, medium autem cœli sit finis 25. graduum & 30. minorum Cancrī, uolo experiri quoniam peruenitura sit directio partis fortunæ in anno uigefimo quinto ætatis: inuenio arcum semidiurnum significatoris 92. graduum & 13. minorum, arcum autem seminocturnum 87. graduum & 47. minorum. Item ascensionem rectam significatoris 175. graduum & 19. minorum, ascensionem autem rectam mediæ cœli 117. graduum & 28. minorum.

Ex ascensione igitur recta significatoris deme 24. gradus anni pro transitu:

factis ab instanti genitura, & relinquuntur 171. gradus cum 27. minutis, quos 24. demum subtraho ascensione recta medij coeli, consumptis 160. gradibus, et remanet elongatio significatoris à meridie 316. graduum & 3. minorum, idum scilicet est in situ promissoris.

Ex hac demum elongatione minuo 180. gradus, relinquitur numerus 146. graduum & 3. minorum: qui cum sit maior arcu seminocturno, necesse est significatorem esse supra terram in quarta orientali, dum uidelicet est in circulo positionis promissoris, quare subtraho 146. gradus & 3. minuta à semicirculo 180. graduum, & relinquetur distantia significatoris à Meridiano, dum est in situ promissoris: quae quidem distantia erit supra terram orientalis.

Significator denique habet declinationem septentrionalem 2. graduum, cum qua, & praedicta distantia eius à Meridiano intro tabulam positionum ad 48. gradus latitudinis, & directè supra distantiam memoratam in fronte tabulae inuenio 31. gradus, unde certior fit quòd polus borealis eleuatur 31. gradibus supra circulum positionis, aut Horizontem significatoris, dum est in situ promissoris.

Quare per tabulam ascensionum obliquarum subiectam 31. gradibus computo ascensionem obliquam significatoris 173. graduum & 12. minorum, ex quo minuo 24. gradus pro 24. annis transactis ab hora geniturae, relinquuntur 149. gradus cum 12. minutis, & tanta est ascensio obliqua loci ad quem perueniet directio, cui ascensioni per tabulam 31. graduum declinationis poli respondent 3. gradus & 30. minuta Virginis. Directio igitur perueniet in anno uigesimo quinto ad quartum gradum Virginis, quod erat exponendum.

VIGESIMVM NONVM PROBLEMA.

Tabulam positionum particularem pro quacumque latitudine à 35. gradibus ad 60. inclusivè articulariter componere.

Fecimus quatuor huiusmodi tabulas positionum particulares, unam quidem pro latitudine 42. graduum, aliam pro latitudine 45. tertiam pro latitudine 48. & quartam pro latitudine 51. graduum, tanquam succeduras nobis ac alijs uiris studiosis artis nostrae amatoribus.

Quamvis autem saltum fecerimus per tres gradus, ita quòd pro binis gradibus medijs proprias tabulas non constituerimus, licet tamen uti tabula quapiam, principaliter quidem & condigne pro latitudine cui inscribitur, rationabiliter autem & prope uerum pro duabus latitudinibus collateralibus: quarum una quidem proximo minor est latitudine tabulam propriam habente, alia autem proximo maior ea. Sic tabula latitudini 42.

c 3 graduum

graduum inscripta duabus etiam latitudinibus, scilicet 34. graduum, hanc
inque accommodabitur: tabula denique pro 51 gradibus contexta 50. &
52. gradibus seruet: non aliter de duabus reliquis intelligendum est. Quo
circa ad latitudines 12. graduum, continet sese sequentium memoratas
quatuor tabule accommodari poterunt.

Si tamen præcilius per has etiam quatuor tabulas operari uolueris lati-
tudine tuæ regionis propriam tabulam non habente,

Accipe primo eleuationem poli supra circulum positionis, ueluti iam
dudum præcepimus, per tabulam latitudinis proximo minoris tua latitu-
dine.

Deinde similiter accipe eleuationem huiusmodi per tabulam latitudinis
proximo maioris, nam tertia pars differentie duarum eleuationum hoc
pacto inuentarum uni gradui latitudinis respondebit, eam itaque partem se-
mel accipe pro uno gradu superfluo ultra numerum latitudinis minoris,
his autem pro duobus.

Si demum minuta iuxta gradus integros inueniat, accipe partem pro-
portionalem de tertia parte prædicta, secundum proportionem minutorum
residuum ad 60, quam adde portioni usque gradus, aut duorum
iam prædem inuenta: aut eam solam tene, si nullus gradus sed minuta dum-
taxat ultra latitudinem minore abundauerint, & habi his portionem re-
spondentem superfluo latitudinis tuæ ultra latitudinem minorem, eam
portionem adde eleuationi poli primæ, si ipsa minor fuerit secunda, aut ab
ea subtrahi si ipsa excesserit secundam, & resultabit eleuatio poli supra cir-
culum positionis quam queribas.

Quod si operatio talis uel serupulosa uel minus iucunda uideretur, poteris
exarare nouam ac propriam tabulam latitudini tuæ.

Huius enim rei gratia tabulam positionum generalem conscripserunt
à 35. gradibus latitudinis incipiente in 34. ad 60. desinentem.

Si autem ad latitudinem quampiam inferiorem 35. gradibus, aut supe-
riorem 60. gradibus, id ipsum liberarè efficere, secundum problematum alma-
gesti consulendus est, ubi exactissimè docetur, quo pacto et generalis positio-
num tabula, & particularis componi debeant.

In huius autem tabule generalis latere sinistro ponuntur numeri eleua-
tionum poli supra circulos positionum, sed in fronte eius latitudines regio-
num à trigintaquinque gradibus usque ad sexaginta querendæ sunt: arcus aut
rem tabule arcus Aequatoris Meridiano & circulis positionum intercep-
tos complectitur.

Conditurus igitur tabulam positionum particularem, scribe primo si-
nistram uersus duos ordines declinationum, primum quidem declinatio-
nis septentrionalis à 32. incipientem, ad nihilque desinentem, stella enim in
Aequat

Aequatore existens nullam habet declinationem, secundum autem ordinem declinationis meridianae ex uno quidem gradu nascentem, & ad 32. finientem. In altero enim horum ordinum quaeri debet declinatio stellae, quemadmodum superius traditum est. In capite autem exarandae tabulae scribe numeros elevationum poli, ab uno quidem initium sumentes, ad latitudinem autem regionis tuae desinentes.

Deinde intra tabulam generalem cum elevatione poli unius gradus, & ex directo eius sub latitudine regionis tuae offendes arcum quendam Aequatoris, quem adde singulis numeris in tabula differentiarum ascensionum reperis sub elevatione poli unius gradus, incipiendo iuxta 32. gradus declinationis, & aggregata huiusmodi per ordinem scribe in area tabulae contexendae sub elevatione poli unius gradus, initium videlicet statuendo iuxta 32. gradus declinationis. In fine autem huius ordinis scribe praedictum arcum Aequatoris solitarii: sic primum ordinem septentrionalem unius gradus absolutum habebis.

Postea ab arcu Aequatoris memorato subtrahere singulas differentias ascensionum praedictas, incipiendo iuxta declinationem unius gradus, & residua scribe iterum in area tabulae exarandae sub elevatione poli unius gradus, initium sumendo apud declinationem unius gradus; hoc itaq; pariter primus ordo meridionalis unius gradus constituetur.

Non autem aliter procedas ad descriptionem duorum ordinum, quos requirit elevatio poli duorum graduum.

Sumpto enim arcu Aequatoris per tabulam generalem, ex directo duorum graduum lateris sinistri, sub latitudine videlicet regionis tuae, cum arcum adde singulis differentiis ascensionum sub elevatione poli duorum graduum positis, & summas additionum scribe in area tabulae componendae sub elevatione poli duorum graduum, incipiendo iterum apud 32. gradus declinationis septentrionalis: in fine autem huius ordinis arcum Aequatoris quem addidisti pone solum, sicut habebis ordinem secundum declinationis septentrionalis.

Ex eodem insuper arcu Aequatoris deme singulas differentias ascensionum praedictas, sub elevatione poli duorum graduum inventas, & residua scribe iterum in area tabulae condendae sub elevatione poli duorum graduum, incipiendo iuxta declinationem unius gradus, hoc etenim praecipit secundum ordinem declinationis meridianae constitues pariformiter ceteros ordines, & tandem integram tabulam positionum regioni tuae absolues.

Exemplum autem hic nullum expectandum est, cum ante oculos habes

as tabulam positionum generalem, & quatuor tabulas positionum particularis construere poteris.

Abolutam igitur habes artem directionum, cuius gratia potissimum hoc scribendi officium assumpsimus. Nunc de aspectibus quoque & radiationibus differendum uideatur, quæ res non modo ad directiones pertinet, uerum etiam ad profectioes significatorum, quam ob rem prius de profectioibus pauca quædam exponantur, de hinc ad aspectus & radiationes calamus uertemus.

VIGESIMUM PROBLEMA.

Quo pertingat profectio significatoris cuiuslibet in tempore aliquo dato, explorare.

Profectio. **P**rofectio est æqualis quedam aut regularis incessio significatoris secundum signorum Zodiaci consequentiam.

Triplex profectio. Tripliciter autem profectiuntur significatores genituræ cuiuslibet, uti placet Ptolemæo circa finem quadripartiti sui, per annos uidelicet, menses, & dies.

Profectio annua. In profectioe annua unicuique anno solari tribuitur signum unum, & si genitura quæpiam habet in ascendente signum Arietis, secundus annus habebit signum Tauri, tertius signum Geminarum, & sic consequenter per ordinem annorum & signorum, usque ad 12. annum, tertiusdecimus item annus habebit Arietem.

Initia autem annorum sumuntur à reditu Solis ad eum locum, in quo erat tempore genituræ, qui ob eam rem anni solares nuncupantur.

In principijs uero omnium annorum ac mensium gradus omnium signorum profectiois æquales esse oportet unde si tertius Arietis ascenderet in genitura quæpiam, ascendens proficisceretur ad tertium Tauri in secundo anno, & ita de cæteris.

Mensuræ. In profectioe autem mensuræ unicuique mensi profectioe datur signum unum, ita quod signum profectiois annuæ sit signum primi mensis eiusdem anni: quamobrem annus solaris in tredecim partes æquales diuisendus est, quarum unaquæque uocabitur mensis profectioe.

Diurna. In profectioe autem diurna duobus diebus tribus horis & 51. minutis serè datur signum unum, ita quod mensis profectioe subdiuiditur in 13. partes æquales. Sic enim in principijs mensium profectioe idem erit signum mensuræ.

De annua profectioe. De profectioe itaque annua hoc breue accipias, diuiso numero annorum

rum

ne.

rum transactionum à tempore geniturae per 12. & residuo computato à signo radices, perducetis ad signum profectiois anni propositi.

Quo autem pettingar profectio mensura ad quodcumque tempus propositum in aliquo anno, sic intelliges.

Primo scias quantum tempus effluxerit ab initio anni solaris currentis, anni scilicet reuolutionis geniturae usque ad tempus propositum, quod computabis hoc pacto:

Vide quantum tempus praeterit ab initio mensis usualis, in quo sit reuolutio natiuitatis usque ad principium anni reuolutionis, hoc est ad diem eiusdem in quo incepit reuolui, & numerum dierum cum horis & minutis adde numero dierum reperto iuxta mensum usualem immediate praecedentem in tabella mensium usualium.

In prima quidem si fuerit annus communis, in secunda autem si bisextilis extiterit, hoc tempus serua per totum annum solarem.

Similiter addisce quantum tempus effluxit ab initio anni Romanorum, usque ad tempus propositum, dempto itaque tempore prius seruato, ex iam nunc inuento tempore reuolutionis, relinquetur tempus transactum ab initio anni reuolutionis usque ad tempus propositum.

Illud tempus quaere in tabula mensium profectioalium, ueluti fieri solet, quando per medium motum cuiuscumque planetae quaeritur tempus ei motui respondens.

Si enim precise inueneris in tabella praedicta dies tuos cum horis & minutis, linea numerorum ostendet numerum mensium profectioalium transactionum ab initio anni reuolutionis currentis;

Si autem non inueneris precise, apud dies proximo pauciores habebis menses exactos, uerum tamen dies huiusmodi pauciores demendi sunt ex diebus tuis quos in tabulam mittere uoluisti, & relinquetur dies superflui cum horis & minutis. Dabis itaque cuilibet mensi profectioali signum unum, incipiendo à signo profectiois annuae, dies autem superfluos cum horis & minutis mitte in tabulam profectiois mensurae, ex directio (ut fieri solet in medijs motibus computandis) habebis gradus cum minutis addendos signis & gradibus prius notatis, sicque perducetis ad locum Zodiaci, quo perueniet profectio in fine totius temporis transacti, quod si modo praedicto cum diebus superfluis ingressus fueris tabulam profectiois diurnae, clicis numerum signorum & graduum computandum à signo profectiois mensurae, ut perducaris ad locum profectiois.

Vice uersa autem, si qua suspitio fuerit alicuius futuri accidentis propter corpus, uel radium alicuius stellae, & uolueris scire quo tempore anni profectio qualiscumque illuc perueniat, cognito intervallo Zodiaci quod est à principio signi profectiois annuae usque ad locum suspectum, inuenies
tempus

tempus ei respondens, quemadmodum in opere mediorum motuum fieri solet, quando medio motui dato tempus suum computare uolumus: quid multis moror? Exemplari computationi facilius rem hanc intelliges, quam longa uerborum ferie.

Sic reuolutio alicuius natiuitatis 6. diebus 5. horis & 10. minutis Martij, completis anno Christi 1467. currente, locus autem Solis tempore geniturae fuerit in fine uiginti quinci gradus Piscium, quae genitura ponatur fu ille anno Christi 1438. currente, uolunt investigare loca profectiois Solis ad 7. dies Iulij completos in anno 1467. currente.

Subtraho 1438. à 1467. remanent 29. anni solares completi, quibus diuisis per 12. relinquuntur 5. sed quintum signum ab Ariete est Leo, illic ergo scilicet in 23. gradu Leonis, est locus profectiois annuae in ultimo die horum annorum, quare in anno trigesimo, qui incipit 6. die 5. hora 10. minuto Martij profectio pertinget ad 26. Virgini, quia profectio nem mensurnam iuxta Februarium inuenio 59. dies, quibus addo 6. 5. 10. Martij colliguntur 65. 5. 10. à principio uidelicet, anni 1467, ad initium anni reuolutionis trigelimi.

Similiter apud Iunium reperio 181. dies, quibus addo 7. dies Iulij, & resultant 188. dies à principio anni 1467. usque ad tempus profectiois. Subtraho itaque 65. 5. 10. à 188. & remanent mihi 122. 28. 50. quos non reperio in tabella mensium profectiois altum, sed numerum proximo minorem 122. 9. 10. 28. subtraho à diebus praedictis, & relinquuntur 10. 9. 39. 32. ultra quatuor menses profectiois: mensis ergo quintus currens habet quintum signum à signo profectiois annuae, id est, Capricornum, incipiendo à uigesimo quinto gradu eius

Postea intro cum diebus superfluis & horis ac minutis horarum, accipiendo signa gradus & minuta, quemadmodum fieri solet in computationibus mediorum motuum, sic inuenio 11. 6. 28. quos addo 25. gradibus Capricorni proueniunt 6. 6. 28. Aquarii, locus scilicet profectiois mensurnae ad 7. dies Iulij completos.

Similiter cum diebus superfluis intro tabulam profectiois diurnae, & inuenio 4. 24. 23. 55. computanda à 25. gradibus Capricorni, & resultat 2. 19. 23. 55. profectio igitur diurna conuocans etiam profectio nem mensurnam perueniet in fine 7. diei Iulij ad 10. graduum Geminorum.

Verum ut loca profectioum habeantur parata ad singulos dies rotius anni, sic procedo, subtraho 5. horas 10. minuta, quae erant iuxta dies reuolutionis

lutionis genituræ à 14. horis, remanent. 18. 50. cum quibus intro tabulam profectio nis mensuræ, & modo supra dicto colligo 0. 50. 16. 18r illud addo 25. gradibus Leonis, resultant 25. 50. 16. Leonis. Hic est locus profectio nis mensuræ, quam uocant etiam profectio nem graduum ad Meridiem 7. diei Martij, cui loco addo portionem profectio nalem unius diei, quæ est unus gradus, 4. minuta & 4. secunda, & proueniunt 26. 54. 20. Leonis, locus scilicet profectio nis ad Meridiem diei octauæ Martij, & sic consequenter usq; ad finem totius anni.

Similiter cum 18. horis & 20. minutis per tabulam profectio nis diurnæ inuenio 10. 53. 34. quos addo 25. gradibus Leonis, resultant, 1. 53. 34. Virginis, locus scilicet profectio nis diurnæ ad Meridiem 7. diei Martij. Deside per additionem continuam portionis profectio nalis diurnæ, quæ est 13. 52. 52. loca profectio num diurnarum ad Meridies singulorum dierum totius anni constitues.

Quemadmodum autem huc usq; circa Solem actum est, de reliquis quoq; significatoribus fiet, quorsum tandem huiusmodi profectio nes tendant, & quantam habeant efficaciam, alibi satis contempleris.

TRIGESIMVM PRIMVM PROBLEMA.

De Aspectibus tandem & radiationibus paucula quedam subiungere.

Radiationes à nonnullis perpenduntur secundum Aequatorem circulum, quamuis diuersimodè, pleriq; enim per ascensiones rectas locum radiationis inquirunt, siue stella radians in Meridiano fuerit, siue extra eum in quocunq; alio situ, pro radiatione enim sextili sinistra ascensionem rectæ ipsius stellæ addunt 60. gradus, & per ascensionem rectam inde resultantem querunt arcum eclipticæ, cuius finem dicunt esse locum radiationis: pro radiatione autem sextili dextra subtrahunt 60. gradus ab ascensione recta stellæ, & cum residuo ut prius querunt arcum eclipticæ, ad cuius finem radiationem huiusmodi desinere arbitrantur.

Non aliter faciunt præ cæteris radiationibus addendo. uel. minuendo interualla unicuiq; radiationi propria. Alij autem exæquuntur id negotium per ascensiones quidam rectas stella Meridianum tenente, per obli quas autem ascensiones regionis si in oriente extiterit, aut per descensiones si in occidente. In locis autem medijs si reperta fuerit stella; radiationes inquirunt per ascensiones promiscuas, ac si uelint scrutari locum, ad quem pertingit directio stellæ propositiæ.

Sunt:

Sunt etiam qui simpliciter considerant radiationes per intervalla gra-
duum eclipticæ. Ioannes autem Blanchinus in circulo quodam super ec-
clipticam inclinato, & per centrum stellæ habentis latitudinem quantam-
cumq; transeunte accipit intervalla radiationum aut aspectuum, cuius quis-
dem circuli polus uterq; est in circulo latitudinis stellæ: ex quibus deniq;
intervallis loca radiationum in ecliptica elicit.

Longum esset particulariter explicare prædictos modos, ac infirmita-
tem eorum demonstrare, quare alibi abundius de his rebus tractare decre-
tum est. Nunc vero breviter intelligatur fundamentum nostræ opinionis,
quælibet stella diffundit radium suum tam luminis quàm qualitatis oc-
cultæ orbiculariter: cum autem infiniti sint tales radij efficaciores, depræ-
hensi sunt quatuor quorum unus quidem est latus sexanguli æquilateri
inscripti circulo per centrum stellæ transeunti, alius autem latus qua-
drati, tertius autem latus trianguli æquilateri, quartus vero diameter eius-
dem circuli.

Quicquid autem hic dicitur de stellis, intelligendum quoq; est de pun-
ctis Zodiaci, alijsq; punctis in concavo primi mobilis existentibus, sub
quibus stellæ ipsæ reperiuntur.

Sermo igitur præfatus fortissimè sit contra omnium stellarum sine in con-
cavo primi mobilis, nec id iniuria, cum in eo concavo loca stellarum con-
sideremus.

Imagino itaq; à puncto cæli quopiam ducti lineam radialem, quæ sit et
qualis lateri sexanguli æquilateri circulo magno primi mobilis inscri-
pti, eamq; circumduci puncto radiante immoto, donec ad finem unde mo-
veri coepit redeat, ita tamen quod reliquis lineæ terminus semper adhæ-
reat concavo primi mobilis: hoc pacto punctus terminalis lineæ memo-
ratæ in concavo cæli describet circumferentiam circuli, quæ si secat eclip-
ticam, eam in duobus punctis secat, quorum alterum quidem est ad dex-
tram, alterum autem ad sinistram, hæc duo puncta sunt loca radiationis
sextilis per excellentiam quandam, quamvis etiam ad omne punctum cir-
cumferentiæ descriptæ radius dictus sextilis terminetur.

Similiter intelligendum est de linea radiationis quadratæ, ac radiationi
triangularis.

Cum ergo scire uolueris locum radiationis sextilis planeta habente la-
titudinem, intra tabellam radiorum cum latitudine planetæ & ex dire-
ctione eius inuenies arcum quandam eclipticæ computandum à loco longi-
tudinis planetæ, secundum successionem quidem signorum pro radiatio-
ne sine

ne sinistra, contra successione[m] autem pro radiatione dextra, cum des-
 nity arcum minue ex 180. gradibus, & residuum numera à loco longi-
 tudinis planete utrunq; pro radiatione triangulari, Locus autem radi-
 ationis quadratæ semper distat à loco longitudinis planete per quadrans
 tem eclipticæ. Radiatio demum opposita ad terminum diametri des-
 sinit. De radiationibus itaq; ac aspectibus pauca quæ-
 dam recensere, ac tandem præsentì nego-
 cio finem sibi imponere.

tere.
